# 1. Introduzione

Questo documento, usato come supporto dell'implementazione, ha lo scopo di produrre un modello capace di integrare in modo coerente e preciso tutti i servizi individuati nelle fasi precedenti. In particolare definisce le interfacce delle classi, le operazioni, i tipi, gli argomenti e la signature dei sottosistemi. Inoltre nei paragrafi successivi sono specificati i trade-off, le linee guida e i design pattern per l'implementazione.

## 1.1. Compromessi dell'Object Design

- **Comprensibilità vs Costi**

Considerando la comprensibilità del codice un aspetto di fondamentale importanza non solo per la manutenzione ma anche per la fase di testing del prodotto, si è scelto di utilizzare i commenti Javadoc oltre ai commenti standard. Ovviamente questa caratteristica aggiungerà dei costi allo sviluppo del progetto ma renderà ogni classe e metodo facilmente interpretabile anche da chi non ha collaborato al progetto.

- **Costi vs Manutenzione**

T.B.D.

## 1.2. Definizioni, acronimi, abbreviazioni

SQL: Structured Query Language.

GUI: Graphical User Interface.

ODD: Object Design Document.

## 2. Linee guida per l'implementazione

### 2.1. Nomi di file

Il software Java utilizza i seguenti suffissi per i file:

- Per i sorgenti Java è: `.java`;
- Per i file Bytecode è `.class`.

### 2.2. Organizzazione dei file

Un file consiste di sezioni che dovrebbero essere separate da linee bianche e un commento opzionale che identifica ogni sezione. File più lunghi di 2000 linee sono ingombranti e devono essere evitati.

#### 2.2.1. File sorgenti

Ogni file sorgente Java contiene una singola classe pubblica o un'interfaccia. Quando ci sono classi e interfacce private associate con la classe pubblica, è possibile inserirle nello stesso file sorgente della classe pubblica. La classe pubblica deve essere la prima classe o interfaccia nel file.

I file sorgenti Java hanno la seguente struttura:

- **COMMENTI DI INIZIO:** tutti i file sorgenti devono iniziare con un commento in stile C che elenca il nome della classe, descrizione, autore e informazioni sulla versione, informazioni di copyright.

```
1  /**
2  * Nome della classe
3  *
4  * Descrizione
5  *
6  * Autore
7  *
8  * Informazione di versione
9  *
10 * 2014 - Copyright by University of Salerno
11 */
12
```

- ISTRUZIONI DI PACKAGE E IMPORT: la prima linea non commento di molti file sorgenti Java è l'istruzione *package* che può essere seguita da istruzioni *import*. Ad esempio:

```
1  package sie.miner.parser;
2
3  import java.util.Map;
4
```

- DICHIARAZIONI DI CLASSE E DI INTERFACCIA: l'ordine in cui le dichiarazioni di una classe o interfaccia devono apparire è il seguente:
  - commento di documentazione della classe/interfaccia (*/\*\* ... \*/*);
  - istruzione *class* o *interface*;
  - commento di implementazione della classe/interfaccia, se necessario: questo commento deve contenere informazioni generali sulla classe o interfaccia che non sono appropriate per il commento di documentazione;
  - variabili di classe (static): prima le variabili di classe public, poi quelle protected e infine quelle private;
  - variabili di istanze: prima quelle public, poi quelle protected e infine quelle private;
  - costruttori;
  - metodi: questi devono essere raggruppati in base alla loro funzionalità piuttosto che in base a regole di visibilità o accessibilità. Ad esempio, un metodo di classe privato può stare tra due metodi pubblici. L'obiettivo è quello di rendere più semplice la lettura e la comprensione del codice.

## 2.3. Indentazione

Come unità di indentazione devono essere usati quattro spazi ma la costruzione della medesima non è specificata (spazi o tabulazioni sono entrambi accettati). Le tabulazioni devono essere settate ogni otto spazi (non quattro).

### 2.3.1. Lunghezza delle linee

Evitare linee più lunghe di ottanta caratteri perché esse non vengono ben gestite da molti terminali e strumenti software. Per la documentazione si utilizza una più corta lunghezza di linea, generalmente non più di settanta caratteri.

### 2.3.2. Spostamento di linee

Quando un'espressione supera la lunghezza della linea, occorre spezzarla secondo i seguenti principi generali:

- interrompere la linea dopo una virgola;
- interrompere la linea prima di un operatore;
- preferire interruzioni di alto livello rispetto ad interruzioni di basso livello;
- allineare la nuova linea con l'inizio dell'espressione nella linea precedente;
- se le regole precedenti rendono il codice più confuso o il codice è troppo spostato verso il margine destro utilizzare solo otto spazi di indentazione.

## 2.4. Commenti

I programmi Java possono avere due tipi di commenti: commenti d'implementazione e commenti di documentazione. I commenti d'implementazione sono quelli classici del C++, che sono delimitati da `/*...*/` e `//`. I commenti di documentazione (noti anche come doc comments) sono esclusivi del Java, e sono delimitati da `/**...*/`. I doc comments possono essere estratti in file HTML utilizzando lo strumento Javadoc. I commenti di implementazione sono dei mezzi per commentare il codice o per commentare una particolare implementazione. I doc comments vengono utilizzati per descrivere la specifica del codice da una prospettiva non implementativa, per essere letti da sviluppatori che non devono necessariamente avere il codice in mano. I commenti dovrebbero essere usati per dare una panoramica del codice e per fornire informazioni aggiuntive che non sono prontamente disponibili nel codice stesso. I commenti devono contenere solo informazioni rilevanti per leggere e comprendere il programma. Ad esempio, informazioni su come il package corrispondente è costruito o in quale directory risiede non dovrebbero essere incluse in un commento.

La discussione sulle decisioni non banali o non ovvie è adatta, ma bisogna evitare di duplicare le informazioni che sono presenti in maniera chiara nel codice. E' molto facile che commenti ridondanti diventino obsoleti; in generale, si dovrebbe evitare di inserire commenti suscettibili di diventare obsoleti con l'evoluzione del software. La frequenza dei commenti talvolta riflette una povera qualità del codice. Quando ci si sente obbligati ad aggiungere un commento, considerare il caso di riscrivere il codice per renderlo più chiaro. I commenti non dovrebbero essere inclusi in grandi riquadri tracciati con asterischi o altri caratteri, né dovrebbero includere caratteri speciali come backspace.

### 2.4.1. Formattazione commento di implementazione

I programmi possono avere tre tipi di commenti di implementazione:

- **COMMENTI DI BLOCCO:** sono usati per fornire descrizioni di file, metodi, strutture dati e algoritmi. I commenti di blocco possono essere usati all'inizio di ogni file e prima di ogni metodo. Possono inoltre essere usati in altri punti, come all'interno dei metodi. I commenti di blocco dentro una funzione o un metodo dovrebbero essere indentati allo stesso livello del codice che descrivono. Un commento di blocco dovrebbe essere preceduto da una linea bianca di separazione dal codice.

```
1  /*
2  * Questo e' un commento di blocco
3  */
4
```

- **COMMENTI A LINEA SINGOLA:** sono brevi commenti che possono apparire su una singola linea di codice ed indentati al livello del codice che seguono. Se un commento non può essere scritto su una linea singola, deve seguire il formato di commento di blocco. Un commento a linea singola deve essere preceduto da una linea bianca. Quello che segue è un esempio di commento a linea singola nel codice Java.

```
1  if(condizione) {
2      /* Gestisce la condizione */
3      ...
4  }
5
```

- **COMMENTI DI FINE LINEA:** Il delimitatore di commento `//` può commentare una linea completa o una parte di essa. Non dovrebbe essere usato su più linee consecutive per commenti testuali; comunque, può essere usato su più linee consecutive per commentare sezioni del codice. Seguono tre esempi dei tre stili.

```
1  if(i>0) {
2      //Fa qualcosa
3      ...
4  } else {
5      i--; //Spiega il perche' qui
6  }
```

```
7
8    //if(x==0) {
9    //
10   //Fa qualcos'altro
11   //...
12   //}
13
```

### 2.4.2. Commenti di documentazione

I *doc comments* descrivono classi Java, interfacce, costruttori, metodi e campo. Ogni doc comment è compreso all'interno dei delimitatori di commento `/** ... *`, con un commento per ogni classe, interfaccia o membro. Questo commento deve apparire solo prima della dichiarazione:

```
1    /**
2    * La classe Esempio fornisce...
3    */
4    public class Esempio {
5        ...
6
```

Un doc comment si compone di una descrizione seguita da un blocco di tag. I tag da utilizzare sono `@author`, `@exception`, `@param`, `@return`, `@see`.

```
1  /**
2  * Verifica l'equivalenza tra due oggetti.
3  * Ritorna un boolean che indica se l'oggetto in cui
4  * mi trovo e' equivalente all'oggetto specificato
5  * come parametro.
6  *
7  * @author      Marco Rossi
8  * @param      obj      l'oggetto che viene confrontato
9  * @return      true     se i due oggetti sono equivalenti
10 *             false    altrimenti
11 *
12 * @see         java.util
13 */
14 public boolean equals(Object obj) {
15     return (this == obj);
16 }
17
```

Notiamo che classi ed interfacce ad alto livello non sono indentate, mentre lo sono i loro membri. La prima linea del commento di documentazione (/\*\*) per classi e interfacce non è indentata; le linee di commento successive hanno ognuna uno spazio di indentazione (per allineare verticalmente gli asterischi). I membri, inclusi i costruttori, hanno quattro spazi per la prima linea del doc comment e cinque spazi per quelli successivi. Se si ha la necessità di dare informazioni circa la classe, l'interfaccia, la variabile o il metodo, che non sono appropriate per la documentazione, usare un commento di implementazione di blocco o a singola linea immediatamente dopo la dichiarazione. Per esempio, i dettagli sull'implementazione di una classe devono andare in un commento di blocco seguente l'istruzione *class*, non nel doc comment della classe. I doc comments non devono essere posizionati dentro il blocco di definizione di un metodo o un costruttore, perché Java associa i commenti di documentazione con la prima dichiarazione dopo il commento.

## 2.5. Dichiarazioni

### 2.5.1. Numero per linea

Una dichiarazione per linea è raccomandata dal momento che incoraggia i commenti. In altre parole

```
1  int livello;           // livello di indentazione
2  int dimensione;       // dimensione della tabella
3
```

è preferito rispetto a

```
1  int livello, dimensione;
2
```

Non inserire tipi differenti sulla stessa linea:

```
1  int livello, varArray[];    //NO!
2
```

Un'altra alternativa accettabile è usare le tabulazioni, cioè:

```
1  int    livello;           // livello di indentazione
2  int    dimensione;       // dimensione della tabella
3  float  posizioneCorrente // posizione della tabella attualmente
4      selezionata
```

### 2.5.2. Inizializzazione

Provare ad inizializzare le variabili locali nel punto in cui sono dichiarate. L'unica ragione per non inizializzare una variabile dove è dichiarata è se il suo valore iniziale dipende da un calcolo che prima occorre eseguire.

### 2.5.3. Posizione

Mettere le dichiarazioni all'inizio dei blocchi. Un blocco è un codice racchiuso entro parentesi graffe aperta e chiusa. Non aspettare di dichiarare le variabili al loro primo uso: può confondere il programmatore inesperto e impedire la portabilità del codice dentro lo scope. L'unica eccezione a questa regola sono gli indici dei cicli for che in Java possono essere dichiarati nell'istruzione stessa.

Evitare dichiarazioni locali che nascondono dichiarazioni a più alto livello. Ad esempio, non dichiarare una variabile con lo stesso nome in un blocco interno.

### 2.5.4. Dichiarazione di Classe e Interfaccia

Quando si codificano classi e interfacce Java, si dovrebbe rispettare le seguenti regole di formattazione:

- Non mettere spazi tra il nome del metodo e la parentesi “{” che apre la lista dei parametri;
- La parentesi graffa aperta “{” si trova alla fine della stessa linea dell'istruzione di dichiarazione;
- La parentesi graffa chiusa “}” inizia una linea indentandosi per mapparsi con la corrispondente istruzione di apertura, eccetto il caso in cui c'è un'istruzione vuota; allora la “}” dovrebbe essere immediatamente dopo la “{”.

## 2.6. Istruzioni

### 2.6.1. Istruzioni semplici

Ogni linea deve contenere al massimo un'istruzione.

```
1 i++;      //Corretto
2 j++;      //Corretto
3 i++; j++; //NO
```

### 2.6.2. Istruzioni composte

Le istruzioni racchiuse dovrebbero essere indendate ad un ulteriore livello rispetto all'istruzione composta.

La parentesi graffa aperta dovrebbe stare alla fine della linea che inizia l'istruzione composta, mentre la parentesi graffa chiusa dovrebbe iniziare una linea ed essere indentata verticalmente con l'inizio dell'istruzione composta.

Le parentesi graffe vanno usate per tutte le dichiarazioni, anche quelle singole, quando sono parte di una struttura di controllo, come nelle istruzioni *if-else* o *for*.

### 2.6.3. Istruzione return

Un'istruzione return con un valore non dovrebbe usare parentesi, a meno che queste rendano in qualche modo il valore ritornato più ovvio.

### 2.6.4. Istruzioni if, if-else, if-else-if else

La classe di istruzioni *if-else* deve avere la seguente forma:

```
1 if(condizione) {  
2     ...  
3 }  
4 if(condizione) {  
5     ...  
6 } else {  
7     ...  
8 }  
9 if (condizione) {  
10    ...  
11 } else if (condizione) {  
12    ...  
13 } else {  
14    ...  
15 }
```

Le istruzioni *if* usano sempre le parentesi graffe.

### 2.6.5. Istruzioni for

Un'istruzione *for* dovrebbe avere la seguente forma.

```
1 for(inizializzazione; condizione; aggiornamento) {  
2     ...  
3 }
```

Quando si usa l'operatore virgola nella clausola di inizializzazione o aggiornamento di un'istruzione *for*, evitare la complessità di utilizzare più di tre variabili. Se necessario, usare istruzioni separate prima del ciclo *for* o alla fine del ciclo.

### 2.6.6. Istruzioni while

Un'istruzione *while* dovrebbe avere la seguente forma:

```
1 while(condizione) {  
2     ...  
3 }
```

### 2.6.7. Istruzioni do-while

Un'istruzione *do-while* dovrebbe avere la seguente forma:

```
1 do {  
2     ...  
3 } while(condizione);
```

### 2.6.8. Istruzione switch

Un'istruzione *switch* dovrebbe avere la seguente forma:

```
1 switch(condizione) {  
2 case ABC:  
3     ...  
4     /* Prosegue oltre */  
5 case DEF:  
6     ...  
7     break;  
8 default:  
9     ...  
10    break;  
11 }
```

Ogni volta che un caso non include l'istruzione *break*, e quindi prosegue al caso successivo, aggiungere un commento nel punto in cui normalmente dovrebbe esserci l'istruzione *break*. Ogni istruzione *break* dovrebbe includere un caso di default. Nel caso di default, l'istruzione *break* è ridondante, ma previene un errore nel caso in cui venga aggiunto un altro case.

### 2.6.9. Istruzioni try-catch

Un'istruzione *try-catch* dovrebbe avere la seguente forma

```
1 try {  
2     ...  
3 } catch(Exception e){  
4     ...  
5 }
```

Un'istruzione *try-catch* può inoltre essere seguita da *finally*, che viene eseguita indipendentemente dal fatto che il blocco *try* sia stato o meno completato con successo.

```
1 try {  
2     ...  
3 } catch(Exception e){  
4     ...  
5 } finally {  
6     ...  
7 }
```

## 2.7. Spazi Bianchi

### 2.7.1. Linee bianche

Due linee bianche dovrebbero essere sempre usate nelle seguenti circostanze:

- fra sezioni di un file sorgente;
- fra definizioni di classe e interfaccia.

Una linea bianca dovrebbe essere sempre usata nelle seguenti circostanze:

- fra metodi;
- fra le variabili locali in un metodo e la sua prima istruzione;
- prima di un commento di blocco o a singola linea;
- fra sezioni logiche all'interno di un metodo.

### 2.7.2. Spazi bianchi

Spazi bianchi dovrebbero essere usati nelle seguenti circostanze:

- una parola chiave seguita da una parentesi dovrebbe essere separata da uno spazio;
- uno spazio bianco non dovrebbe essere usato fra il nome di un metodo e le sue parentesi d'apertura;
- uno spazio bianco dovrebbe essere interposto dopo le virgole nelle liste di argomenti;
- tutti gli operatori binari eccetto l'operatore punto, dovrebbero essere separati dai loro operandi tramite spazi. Gli spazi bianchi non dovrebbero mai separare gli operandi unari come l'operatore meno, l'incremento e il decremento.

## 2.8. Convenzione di nomi

### 2.8.1. Classi

I nomi di classe dovrebbero essere sostantivi, con le lettere minuscole e, sia la prima lettera del nome della classe, sia la prima lettera di ogni parola interna, deve essere maiuscola (convenzione *camel case*).

Cercare di rendere i nomi delle classi semplici, descrittivi e che rispettino il dominio applicativo. Usare parole intere evitando acronimi e abbreviazioni (a me no che l'abbreviazione sia più usata della forma lunga, come URL o HTML).

Non dovrebbero essere usati underscore per legare nomi. Per i Bean, è necessario far iniziare il nome della classe con il prefisso *Bean*.

### 2.8.2. Interfacce

I nomi di interfaccia iniziano con la lettera *I* e seguono le stesse regole dei nomi di classi.

### 2.8.3. Metodi

I nomi dei metodi devono essere verbi con iniziale minuscola e a gobba di cammello. Cercare di rendere i nomi dei metodi semplici, descrittivi e che rispettino il dominio applicativo. I nomi dei metodi non devono iniziare con caratteri di underscore o di dollaro. Usare parole intere evitando acronimi e abbreviazioni, a meno che l'abbreviazione sia più usata della forma lunga, come URL o HTML. Non dovrebbero essere usati underscore per legare nomi.

### 2.8.4. Variabili

Tutte le variabili e le istanze di classe devono essere scritte con iniziale minuscola e a gobba di cammello. I nomi delle variabili devono essere in inglese. Non devono iniziare con caratteri di underscore o dollaro. La scelta di un nome deve essere mnemonica e deve rispettare il dominio applicativo. Le variabili utilizzate come argomenti di funzioni devono iniziare con la lettera "*p*". Le variabili che identificano una collezione di oggetti devono chiamarsi con lo stesso nome dell'oggetto contenuto nella lista e terminare con la lettera "*s*". I nomi di variabili di un solo carattere dovrebbero essere evitati.

### 2.8.5. Costanti

I nomi delle variabili dichiarate come costanti di classe devono essere scritte in lettere tutte maiuscole con le parole separate da underscore. I nomi delle costanti devono essere in inglese. La scelta di un nome deve essere mnemonica e deve rispettare il dominio applicativo.

## 2.9. Consuetudini di programmazione

### 2.9.1. Fornire accesso a variabili di istanza o di classe

Non rendere pubblica una variabile di istanza o di classe senza una buona ragione. Le variabili di istanza devono essere scritte o lette attraverso delle chiamate e metodi.

### 2.9.2. Riferire variabili a metodi di classe

Evitare di usare un oggetto per accedere a variabili o metodi di classe *static*. Usare invece il nome della classe.

### 2.9.3. Assegnamento di variabili

Evitare di assegnare a più variabili lo stesso valore in una sola istruzione. Non usare l'operatore di assegnamento in un punto in cui può essere facilmente confuso con l'operatore di uguaglianza. Non usare assegnamenti innestati nel tentativo di migliorare le prestazioni a tempo di esecuzione. Questo è compito del compilatore!

### 2.9.4. Parentesi

È generalmente una buona idea usare le parentesi liberamente in espressioni che coinvolgono operatori misti per evitare problemi di precedenza degli operatori.

### 2.9.5. Valori ritornati

Provare a rendere la struttura del programma aderente alle proprie intenzioni.

## 3. Design Pattern

### 3.1. DAO Pattern

Per quanto riguarda la logica di accesso alla sorgente di dati, si è deciso di utilizzare il pattern DAO.

L'idea del pattern DAO (Data Access Object) è di disaccoppiare la logica di business dalla logica di accesso ai dati. Questo si ottiene spostando la logica di accesso ai dati dai componenti di business ad una classe DAO. Questo approccio garantisce che un eventuale cambiamento del dispositivo di persistenza non comporti modifiche sui componenti di business.

Esiste una classe DAO per ogni classe che rappresenta entità del dominio di applicazione. Questa classe conterrà i metodi di integrazione e manipolazione della corrispondente classe di dominio. In particolare conterrà le funzionalità di base CRUD.

- Create
- Read
- Update
- Delete

#### Struttura

Il DAO viene invocato dal Business Object e si occupa di effettuare l'accesso ai dati restituendoli all'applicazione.

Le informazioni che il DAO restituisce al Business Object sono oggetti generici, indipendenti dal dispositivo di persistenza, e le eventuali eccezioni specifiche della risorsa dati sono mascherate in eccezioni generiche di tipo applicativo.

## 5.1. Package `it.unisa.sesa.repominer.actions`

*Package Contents*

*Page*

### Classes

<b>HistoryMetricsAction</b> .....	<b>24</b>
Our sample action implements workbench action delegate.	

### 5.1.1. Class HistoryMetricsAction

Our sample action implements workbench action delegate. The action proxy will be created by the workbench and shown in the UI. When the user tries to use the action, this delegate will be created and execution will be delegated to it.

#### See also

- IWorkbenchWindowActionDelegate

#### Declaration

```
public class HistoryMetricsAction
extends java.lang.Object
```

#### Constructor summary

[HistoryMetricsAction\(\)](#) The constructor.

#### Method summary

[dispose\(\)](#) We can use this method to dispose of any system resources we previously allocated.

[init\(IWorkbenchWindow\)](#) We will cache window object in order to be able to provide parent shell for the message dialog.

[run\(IAction\)](#) The action has been activated.

[selectionChanged\(IAction, ISelection\)](#) Selection in the workbench has been changed.

#### Constructors

- **HistoryMetricsAction**  
`public HistoryMetricsAction()`
  - **Description**  
The constructor.

#### Methods

- **dispose**  
`public void dispose()`
  - **Description**  
We can use this method to dispose of any system resources we previously allocated.

- **See also**
  - \* IWorkbenchWindowActionDelegate#dispose
- **init**

```
public void init(IWorkbenchWindow window)
```

  - **Description**

We will cache window object in order to be able to provide parent shell for the message dialog.
  - **See also**
    - \* IWorkbenchWindowActionDelegate#init
- **run**

```
public void run(IAction action)
```

  - **Description**

The action has been activated. The argument of the method represents the 'real' action sitting in the workbench UI.
  - **See also**
    - \* IWorkbenchWindowActionDelegate#run
- **selectionChanged**

```
public void selectionChanged(IAction action, ISelection selection)
```

  - **Description**

Selection in the workbench has been changed. We can change the state of the 'real' action here if we want, but this can only happen after the delegate has been created.
  - **See also**
    - \* IWorkbenchWindowActionDelegate#selectionChanged

## 5.2. Package `it.unisa.sesa.repominer`

*Package Contents*

*Page*

### Classes

<b>Activator</b> .....	<a href="#">25</a>
------------------------	--------------------

The activator class controls the plug-in life cycle

### 5.2.1. Class **Activator**

The activator class controls the plug-in life cycle

## Declaration

```
public class Activator
extends AbstractUIPlugin
```

## Field summary

**PLUGIN\_ID**

## Constructor summary

**Activator()** The constructor

## Method summary

**getDefault()** Returns the shared instance  
**getImageDescriptor(String)** Returns an image descriptor for the image  
file at the given plug-in relative path  
**start(BundleContext)**  
**stop(BundleContext)**

## Fields

- public static final java.lang.String **PLUGIN\_ID**

## Constructors

- **Activator**  
public **Activator()**
  - **Description**  
The constructor

## Methods

- **getDefault**  
public static Activator **getDefault()**
  - **Description**  
Returns the shared instance
  - **Returns** – the shared instance
- **getImageDescriptor**  
public static ImageDescriptor **getImageDescriptor(java.lang.String path)**

- **Description**  
Returns an image descriptor for the image file at the given plug-in relative path
- **Parameters**  
\* path – the path
- **Returns** – the image descriptor
- **start**  
public void start(BundleContext context) throws java.lang.Exception
- **stop**  
public void stop(BundleContext context) throws java.lang.Exception

### 5.3.1. Class ChangeDAO

#### Declaration

```
public class ChangeDAO
extends java.lang.Object
```

#### Constructor summary

[ChangeDAO\(\)](#)

#### Method summary

[getChangeById\(Integer\)](#) This method return a single commit picked by id

[getChangesByDateInterval\(Project, Date, Date\)](#) This method return all commit occurred between two given dates in project passed as parameter

[getChangesOfProject\(Project\)](#) This method returns all commits occurred in project passed as parameter

[getProjectEndDate\(Project\)](#) This method return the date of last change occurred in project passed as parameter

[getProjectStartDate\(Project\)](#) This method return the date of first change occurred in project passed as parameter

#### Constructors

- **ChangeDAO**  
public **ChangeDAO()**

#### Methods

- **getChangeById**  
public entities.Change **getChangeById**(java.lang.Integer pId)
  - **Description**  
This method return a single commit picked by id
  - **Parameters**  
\* pId –
  - **Returns** – A Change object

- **getChangesByDateInterval**

```
public java.util.List getChangesByDateInterval(entities.Project pProject, java.util.Date pDate1, java.util.Date pDate2)
```

- **Description**

This method return all commit occurred between two given dates in project passed as parameter

- **Parameters**

- \* pProject –
    - \* pDate1 –
    - \* pDate2 –

- **Returns** – A list of Change objects

- **getChangesOfProject**

```
public java.util.List getChangesOfProject(entities.Project pProject)
```

- **Description**

This method returns all commits occurred in project passed as parameter

- **Parameters**

- \* pProject –

- **Returns** – A list of Change objects

- **getProjectEndDate**

```
public java.util.Date getProjectEndDate(entities.Project pProject)
```

- **Description**

This method return the date of last change occurred in project passed as parameter

- **Parameters**

- \* pProject –

- **Returns** – A Date (last in project); return current date if query get a null change

- **getProjectStartDate**

```
public java.util.Date getProjectStartDate(entities.Project pProject)
```

- **Description**

This method return the date of first change occurred in project passed as parameter

- **Parameters**

- \* pProject –
- **Returns** – A Date (first in project); return current date if query get a null Change

### 5.3.2. Class ChangeForCommitDAO

#### Declaration

```
public class ChangeForCommitDAO
extends java.lang.Object
```

#### Constructor summary

[ChangeForCommitDAO\(\)](#)

#### Method summary

- [getChangeForCommitById\(Integer\)](#) This method returns a single change occurred in a commit picked by id
- [getChangeForCommitOfChange\(Change\)](#) This method returns all changes occurred for a single commit passed as parameter
- [getChangesForCommitByProject\(Project\)](#) This method returns all changes occurred in all commits which refer to a project passed as parameter

#### Constructors

- **ChangeForCommitDAO**  
public **ChangeForCommitDAO()**

#### Methods

- **getChangeForCommitById**  
public entities.ChangeForCommit **getChangeForCommitById**(java.lang.Integer pId)
  - **Description**  
This method returns a single change occurred in a commit picked by id
  - **Parameters**  
\* pId –
  - **Returns** – A ChangeForCommit object
- **getChangeForCommitOfChange**  
public java.util.List **getChangeForCommitOfChange**(entities.Change pChange)

- **Description**  
This method returns all changes occurred for a single commit passed as parameter
  - **Parameters**
    - \* `pChange` –
  - **Returns** – A list of `ChangeForCommit` objects
- **getChangesForCommitByProject**  
`public java.util.List getChangesForCommitByProject(entities.Project pProject)`
    - **Description**  
This method returns all changes occurred in all commits which refer to a project passed as parameter
    - **Parameters**
      - \* `pProject` –
    - **Returns** – A list of `ChangeForCommit` objects

### 5.3.3. Class `ConnectionPool`

#### Declaration

```
public class ConnectionPool
extends java.lang.Object
```

#### Method summary

```
getConnection()
getInstance()
releaseConnection(Connection)
```

#### Methods

- **getConnection**  
`public java.sql.Connection getConnection()`
- **getInstance**  
`public static ConnectionPool getInstance()`
- **releaseConnection**  
`public void releaseConnection(java.sql.Connection connection)`

### 5.3.4. Class ImportDAO

#### Declaration

```
public class ImportDAO  
extends java.lang.Object
```

#### Constructor summary

[ImportDAO\(\)](#)

#### Method summary

[getImportById\(Integer\)](#) This method returns a name of package picked by its id, passed as parameter

#### Constructors

- **ImportDAO**  
public **ImportDAO()**

#### Methods

- **getImportById**  
public entities.Import **getImportById**(java.lang.Integer pId)
  - **Description**  
This method returns a name of package picked by its id, passed as parameter
  - **Parameters**
    - \* pId –
  - **Returns** – An Import object

### 5.3.5. Class IssueDAO

#### Declaration

```
public class IssueDAO  
extends java.lang.Object
```

#### Constructor summary

[IssueDAO\(\)](#)

### Method summary

- [getIssueById\(Integer\)](#) Returns a single issue picked by its id, picked as parameter
- [getIssuesByProject\(Project\)](#) Returns all issues for a project passed as parameter

### Constructors

- **IssueDAO**  
`public IssueDAO()`

### Methods

- **getIssueById**  
`public entities.Issue getIssueById(java.lang.Integer pId)`
  - **Description**  
Returns a single issue picked by its id, picked as parameter
  - **Parameters**
    - \* `pId` –
  - **Returns** – An Issue object
- **getIssuesByProject**  
`public java.util.List getIssuesByProject(entities.Project pProject)`
  - **Description**  
Returns all issues for a project passed as parameter
  - **Parameters**
    - \* `pProject` –
  - **Returns** – A list of Issue objects

## 5.3.6. Class MethodDAO

### Declaration

```
public class MethodDAO
extends java.lang.Object
```

### Constructor summary

[MethodDAO\(\)](#)

### Method summary

[getMethodsOfType\(Type\)](#) This method return the list of methods for a class

### Constructors

- **MethodDAO**  
`public MethodDAO()`

### Methods

- **getMethodsOfType**  
`public java.util.List getMethodsOfType(entities.Type pType)`
  - **Description**  
This method return the list of methods for a class
  - **Parameters**
    - \* `pType` –
  - **Returns** – A list of Method objects

## 5.3.7. Class MetricDAO

### Declaration

```
public class MetricDAO
extends java.lang.Object
```

### Constructor summary

[MetricDAO\(\)](#)

### Method summary

[saveMetric\(Metric\)](#) This method saves in database a metric passed as parameter

### Constructors

- **MetricDAO**  
`public MetricDAO()`

**Methods**

- **saveMetric**

```
public java.lang.Integer saveMetric(entities.Metric pMetric)
```

- **Description**

This method saves in database a metric passed as parameter

- **Parameters**

\* pMetric –

**5.3.8. Class MetricMethodDAO****Declaration**

```
public class MetricMethodDAO
extends java.lang.Object
```

**Constructor summary**

[MetricMethodDAO\(\)](#)

**Method summary**

[getMetric\(Metric, Method\)](#) This method return a metric of a method

[getMetricsOfMethod\(Method\)](#) This method return a list of metrics method

**Constructors**

- **MetricMethodDAO**

```
public MetricMethodDAO()
```

**Methods**

- **getMetric**

```
public entities.MetricMethod getMetric(entities.Metric pMetric, entities.Method
pMethod)
```

- **Description**

This method return a metric of a method

- **Parameters**

\* pMetric –

\* pMethod –

- **Returns** – A MetricMethod object

- **getMetricsOfMethod**  
`public java.util.List getMetricsOfMethod(entities.Method pMethod)`
  - **Description**  
This method return a list of metrics method
  - **Parameters**  
    - \* `pMethod` –
  - **Returns** – A list of `MetricMethod` objects

### 5.3.9. Class `PackageMetricDAO`

#### Declaration

```
public class PackageMetricDAO
extends java.lang.Object
```

#### Constructor summary

[`PackageMetricDAO\(\)`](#)

#### Method summary

[`getMetric\(Metric, SourceContainer\)`](#) This method return a single package metric picked by metric and package id  
[`getMetricsOfPackage\(SourceContainer\)`](#) This method returns a list of package metrics for package as parameter  
[`saveMetric\(PackageMetric\)`](#) This method saves or update a package metric into database

#### Constructors

- **PackageMetricDAO**  
`public PackageMetricDAO()`

#### Methods

- **getMetric**  
`public entities.PackageMetric getMetric(entities.Metric pMetric, entities.SourceContainer pSourceContainer)`
  - **Description**  
This method return a single package metric picked by metric and package id
  - **Parameters**

- \* pMetric –
  - \* pSourceContainer –
  - **Returns** – A PackageMetric object
- **getMetricsOfPackage**  
 public java.util.List getMetricsOfPackage(entities.SourceContainer pSourceContainer)
  - **Description**  
 This method returns a list of package metrics for package as parameter
  - **Parameters**
    - \* pSourceContainer –
  - **Returns** – A list of PackageMetric objects
- **saveMetric**  
 public void saveMetric(entities.PackageMetric pPackageMetric)
  - **Description**  
 This method saves or update a package metric into database
  - **Parameters**
    - \* pPackageMetric –

### 5.3.10. Class ProjectDAO

#### Declaration

```
public class ProjectDAO
extends java.lang.Object
```

#### Constructor summary

[ProjectDAO\(\)](#)

#### Method summary

[getProject\(Integer\)](#) Returns project searched by id  
[getProject\(String\)](#) Returns a project searched by name

#### Constructors

- **ProjectDAO**  
 public ProjectDAO()

## Methods

- **getProject**  
`public entities.Project getProject(java.lang.Integer pId)`
  - **Description**  
Returns project searched by id
  - **Parameters**
    - \* pId –
  - **Returns** – A Project class
- **getProject**  
`public entities.Project getProject(java.lang.String pName)`
  - **Description**  
Returns a project searched by name
  - **Parameters**
    - \* pName –
  - **Returns** – A Project class

### 5.3.11. Class ProjectMetricDAO

#### Declaration

```
public class ProjectMetricDAO
extends java.lang.Object
```

#### Constructor summary

[ProjectMetricDAO\(\)](#)

#### Method summary

[getMetric\(Metric, Project\)](#) This method returns a single project metric picked by metric and project id

[getMetricsOfProject\(Project\)](#) This method returns a list of project metrics for a project passed as parameter

[saveMetric\(ProjectMetric\)](#) This method save a project metric into database

#### Constructors

- **ProjectMetricDAO**  
`public ProjectMetricDAO()`

## Methods

- **getMetric**

```
public entities.ProjectMetric getMetric(entities.Metric pMetric, entities.Project pProject)
```

- **Description**

This method returns a single project metric picked by metric and project id

- **Parameters**

- \* pMetric –
    - \* pProject –

- **Returns** –

- **getMetricsOfProject**

```
public java.util.List getMetricsOfProject(entities.Project pProject)
```

- **Description**

This method returns a list of project metrics for a project passed as parameter

- **Parameters**

- \* pProject –

- **Returns** – A list of ProjectMetric objects

- **saveMetric**

```
public void saveMetric(entities.ProjectMetric pProjectMetric)
```

- **Description**

This method save a project metric into database

- **Parameters**

- \* pProjectMetric –

### 5.3.12. Class SourceContainerDAO

#### Declaration

```
public class SourceContainerDAO  
extends java.lang.Object
```

#### Constructor summary

[SourceContainerDAO\(\)](#)

### Method summary

[getPackages\(Project\)](#) Returns all packages contained in project passed as parameter

[getPackagesById\(Integer\)](#) Returns a single package picked by id

### Constructors

- **SourceContainerDAO**  
`public SourceContainerDAO()`

### Methods

- **getPackages**  
`public java.util.List getPackages(entities.Project pProject)`
  - **Description**  
Returns all packages contained in project passed as parameter
  - **Parameters**
    - \* `pProject` –
  - **Returns** – List of SourceContainer objects
- **getPackagesById**  
`public entities.SourceContainer getPackagesById(java.lang.Integer pId)`
  - **Description**  
Returns a single package picked by id
  - **Parameters**
    - \* `pId` –
  - **Returns** – A SourceContainer object

## 5.3.13. Class TypeDAO

### Declaration

```
public class TypeDAO
extends java.lang.Object
```

### Constructor summary

[TypeDAO\(\)](#)

## Method summary

- `getClassById(Integer)`** Returns a single class picked by id
- `getClassesByPackage(SourceContainer)`** Returns all classes contained in the package passed as parameter
- `getSystemNumberOfTypes(Project)`** Return the overall number of types in project passed as parameter

## Constructors

- **TypeDAO**  
`public TypeDAO()`

## Methods

- **getClassById**  
`public entities.Type getClassById(java.lang.Integer pId)`
  - **Description**  
Returns a single class picked by id
  - **Parameters**
    - \* `pId` –
  - **Returns** – A Type object
- **getClassesByPackage**  
`public java.util.List getClassesByPackage(entities.SourceContainer pSourceContainer)`
  - **Description**  
Returns all classes contained in the package passed as parameter
  - **Parameters**
    - \* `pSourceContainer` –
  - **Returns** – A list of Type objects
- **getSystemNumberOfTypes**  
`public int getSystemNumberOfTypes(entities.Project pProject)`
  - **Description**  
Return the overall number of types in project passed as parameter
  - **Parameters**
    - \* `pProject` – selected project
  - **Returns** – number of types in project

### 5.4.1. Class CaughtException

#### Declaration

```
public class CaughtException
extends java.lang.Object
```

#### Constructor summary

```
CaughtException()
CaughtException(Integer, Integer)
```

#### Method summary

```
equals(Object)
getExceptionTypeId()
getMethodId()
hashCode()
setExceptionTypeId(Integer)
setMethodId(Integer)
toString()
```

#### Constructors

- CaughtException  
public CaughtException()
- CaughtException  
public CaughtException(java.lang.Integer methodId, java.lang.Integer exceptionTypeId)

#### Methods

- equals  
public boolean equals(java.lang.Object arg0)
- getExceptionTypeId  
public java.lang.Integer getExceptionTypeId()

- **getMethodId**  
`public java.lang.Integer getMethodId()`
- **hashCode**  
`public native int hashCode()`
- **setExceptionTypeId**  
`public void setExceptionTypeId(java.lang.Integer exceptionTypeId)`
- **setMethodId**  
`public void setMethodId(java.lang.Integer methodId)`
- **toString**  
`public java.lang.String toString()`

### 5.4.2. Class Change

#### Declaration

```
public class Change
extends java.lang.Object
```

#### Constructor summary

```
Change()
Change(Integer, String, Date, String, String, String, Integer)
```

#### Method summary

```
equals(Object)
getCommitDate()
getDevId()
getDevMail()
getHash()
getId()
getMessage()
getProjectId()
hashCode()
setCommitDate(Date)
setDevId(String)
setDevMail(String)
setHash(String)
setId(Integer)
setMessage(String)
setProjectId(Integer)
toString()
```

## Constructors

- **Change**  
`public Change()`
- **Change**  
`public Change(java.lang.Integer id, java.lang.String hash, java.util.Date commitDate, java.lang.String devMail, java.lang.String devId, java.lang.String message, java.lang.Integer projectId)`

## Methods

- **equals**  
`public boolean equals(java.lang.Object arg0)`
- **getCommitDate**  
`public java.util.Date getCommitDate()`
- **getDevId**  
`public java.lang.String getDevId()`
- **getDevMail**  
`public java.lang.String getDevMail()`
- **getHash**  
`public java.lang.String getHash()`
- **getId**  
`public java.lang.Integer getId()`
- **getMessage**  
`public java.lang.String getMessage()`
- **getProjectId**  
`public java.lang.Integer getProjectId()`
- **hashCode**  
`public native int hashCode()`
- **setCommitDate**  
`public void setCommitDate(java.util.Date commitDate)`
- **setDevId**  
`public void setDevId(java.lang.String devId)`
- **setDevMail**  
`public void setDevMail(java.lang.String devMail)`

- **setHash**  
`public void setHash(java.lang.String hash)`
- **setId**  
`public void setId(java.lang.Integer id)`
- **setMessage**  
`public void setMessage(java.lang.String message)`
- **setProjectId**  
`public void setProjectId(java.lang.Integer projectId)`
- **toString**  
`public java.lang.String toString()`

### 5.4.3. Class ChangeForCommit

#### Declaration

```
public class ChangeForCommit  
extends java.lang.Object
```

#### Constructor summary

```
ChangeForCommit\(\)  
ChangeForCommit\(Integer, Integer, String, Integer, Integer\)
```

#### Method summary

```
equals\(Object\)  
getChangeHashId\(\)  
getDeletions\(\)  
getId\(\)  
getInsertions\(\)  
getModifiedFile\(\)  
hashCode\(\)  
setChangeHashId\(Integer\)  
setDeletions\(Integer\)  
setId\(Integer\)  
setInsertions\(Integer\)  
setModifiedFile\(String\)  
toString\(\)
```

## Constructors

- **ChangeForCommit**  
`public ChangeForCommit()`
- **ChangeForCommit**  
`public ChangeForCommit(java.lang.Integer id, java.lang.Integer changeHashId, java.lang.String modifiedFile, java.lang.Integer insertions, java.lang.Integer deletions)`

## Methods

- **equals**  
`public boolean equals(java.lang.Object arg0)`
- **getChangeHashId**  
`public java.lang.Integer getChangeHashId()`
- **getDeletions**  
`public java.lang.Integer getDeletions()`
- **getId**  
`public java.lang.Integer getId()`
- **getInsertions**  
`public java.lang.Integer getInsertions()`
- **getModifiedFile**  
`public java.lang.String getModifiedFile()`
- **hashCode**  
`public native int hashCode()`
- **setChangeHashId**  
`public void setChangeHashId(java.lang.Integer changeHash)`
- **setDeletions**  
`public void setDeletions(java.lang.Integer deletions)`
- **setId**  
`public void setId(java.lang.Integer id)`
- **setInsertions**  
`public void setInsertions(java.lang.Integer insertions)`
- **setModifiedFile**  
`public void setModifiedFile(java.lang.String modifiedFile)`
- **toString**  
`public java.lang.String toString()`

### 5.4.4. Class ClassInvocation

#### Declaration

```
public class ClassInvocation
extends java.lang.Object
```

#### Constructor summary

```
ClassInvocation\(\)
ClassInvocation\(Integer, Integer\)
```

#### Method summary

```
equals\(Object\)
getInvokedClassId\(\)
getInvokerClassId\(\)
hashCode\(\)
setInvokedClassId\(Integer\)
setInvokerClassId\(Integer\)
toString\(\)
```

#### Constructors

- **ClassInvocation**  
public **ClassInvocation()**
- **ClassInvocation**  
public **ClassInvocation**(java.lang.Integer invokedClassId, java.lang.Integer invokerClassId)

#### Methods

- **equals**  
public boolean **equals**(java.lang.Object arg0)
- **getInvokedClassId**  
public java.lang.Integer **getInvokedClassId()**
- **getInvokerClassId**  
public java.lang.Integer **getInvokerClassId()**
- **hashCode**  
public native int **hashCode()**
- **setInvokedClassId**  
public void **setInvokedClassId**(java.lang.Integer invokedClassId)

- **setInvokerClassId**  
`public void setInvokerClassId(java.lang.Integer invokerClassId)`
- **toString**  
`public java.lang.String toString()`

### 5.4.5. Class Import

#### Declaration

```
public class Import
extends java.lang.Object
```

#### Constructor summary

```
Import()
Import(Integer, String)
```

#### Method summary

```
equals(Object)
getId()
getName()
hashCode()
setId(Integer)
setName(String)
toString()
```

#### Constructors

- **Import**  
`public Import()`
- **Import**  
`public Import(java.lang.Integer id, java.lang.String name)`

#### Methods

- **equals**  
`public boolean equals(java.lang.Object arg0)`
- **getId**  
`public java.lang.Integer getId()`
- **getName**  
`public java.lang.String getName()`

- **hashCode**  
`public native int hashCode()`
- **setId**  
`public void setId(java.lang.Integer id)`
- **setName**  
`public void setName(java.lang.String name)`
- **toString**  
`public java.lang.String toString()`

### 5.4.6. Class Imports

#### Declaration

```
public class Imports
extends java.lang.Object
```

#### Constructor summary

```
Imports()
Imports(Integer, Integer)
```

#### Method summary

```
equals(Object)
getImportedId()
getImporterId()
hashCode()
setImportedId(Integer)
setImporterId(Integer)
toString()
```

#### Constructors

- **Imports**  
`public Imports()`
- **Imports**  
`public Imports(java.lang.Integer importerId, java.lang.Integer importedId)`

## Methods

- **equals**  
`public boolean equals(java.lang.Object arg0)`
- **getImportedId**  
`public java.lang.Integer getImportedId()`
- **getImporterId**  
`public java.lang.Integer getImporterId()`
- **hashCode**  
`public native int hashCode()`
- **setImportedId**  
`public void setImportedId(java.lang.Integer importedId)`
- **setImporterId**  
`public void setImporterId(java.lang.Integer importerId)`
- **toString**  
`public java.lang.String toString()`

### 5.4.7. Class Issue

#### Declaration

```
public class Issue
extends java.lang.Object
```

#### Constructor summary

```
Issue()
Issue(Integer, String, String, String, String, String, String, String,
String, String, Date, Date, Date, Integer)
```

#### Method summary

```
equals(Object)
getAffectedVersion()
getAssignee()
getClosed()
getComponent()
getCreated()
getFixVersion()
getId()
```

```
getPriority()  
getProjectId()  
getReporter()  
getResolution()  
getStatus()  
getType()  
getUpdated()  
hashCode()  
setAffectedVersion(String)  
setAssignee(String)  
setClosed(Date)  
setComponent(String)  
setCreated(Date)  
setFixVersion(String)  
setId(Integer)  
setPriority(String)  
setProjectId(Integer)  
setReporter(String)  
setResolution(String)  
setStatus(String)  
setType(String)  
setUpdated(Date)  
toString()
```

## Constructors

- **Issue**  
`public Issue()`
- **Issue**  
`public Issue(java.lang.Integer id, java.lang.String type, java.lang.String priority, java.lang.String status, java.lang.String resolution, java.lang.String affectedVersion, java.lang.String component, java.lang.String fixVersion, java.lang.String assignee, java.lang.String reporter, java.util.Date updated, java.util.Date closed, java.util.Date created, java.lang.Integer projectId)`

## Methods

- **equals**  
`public boolean equals(java.lang.Object arg0)`
- **getAffectedVersion**  
`public java.lang.String getAffectedVersion()`

- **getAssignee**  
public java.lang.String getAssignee()
- **getClosed**  
public java.util.Date getClosed()
- **getComponent**  
public java.lang.String getComponent()
- **getCreated**  
public java.util.Date getCreated()
- **getFixVersion**  
public java.lang.String getFixVersion()
- **getId**  
public java.lang.Integer getId()
- **getPriority**  
public java.lang.String getPriority()
- **getProjectId**  
public java.lang.Integer getProjectId()
- **getReporter**  
public java.lang.String getReporter()
- **getResolution**  
public java.lang.String getResolution()
- **getStatus**  
public java.lang.String getStatus()
- **getType**  
public java.lang.String getType()
- **getUpdated**  
public java.util.Date getUpdated()
- **hashCode**  
public native int hashCode()
- **setAffectedVersion**  
public void setAffectedVersion(java.lang.String affectedVersion)
- **setAssignee**  
public void setAssignee(java.lang.String assignee)

- **setClosed**  
`public void setClosed(java.util.Date closed)`
- **setComponent**  
`public void setComponent(java.lang.String component)`
- **setCreated**  
`public void setCreated(java.util.Date created)`
- **setFixVersion**  
`public void setFixVersion(java.lang.String fixVersion)`
- **setId**  
`public void setId(java.lang.Integer id)`
- **setPriority**  
`public void setPriority(java.lang.String priority)`
- **setProjectId**  
`public void setProjectId(java.lang.Integer projectId)`
- **setReporter**  
`public void setReporter(java.lang.String reporter)`
- **setResolution**  
`public void setResolution(java.lang.String resolution)`
- **setStatus**  
`public void setStatus(java.lang.String status)`
- **setType**  
`public void setType(java.lang.String type)`
- **setUpdated**  
`public void setUpdated(java.util.Date updated)`
- **toString**  
`public java.lang.String toString()`

#### 5.4.8. Class IssueAttachment

##### Declaration

```
public class IssueAttachment
extends java.lang.Object
```

**Constructor summary**

[IssueAttachment\(\)](#)  
[IssueAttachment\(Integer, Date, String, Integer\)](#)

**Method summary**

[equals\(Object\)](#)  
[getBelongingIssueId\(\)](#)  
[getDate\(\)](#)  
[getId\(\)](#)  
[getName\(\)](#)  
[hashCode\(\)](#)  
[setBelongingIssueId\(Integer\)](#)  
[setDate\(Date\)](#)  
[setId\(Integer\)](#)  
[setName\(String\)](#)  
[toString\(\)](#)

**Constructors**

- **IssueAttachment**  
`public IssueAttachment()`
- **IssueAttachment**  
`public IssueAttachment(java.lang.Integer id, java.sql.Date date, java.lang.String name, java.lang.Integer belongingIssueId)`

**Methods**

- **equals**  
`public boolean equals(java.lang.Object arg0)`
- **getBelongingIssueId**  
`public java.lang.Integer getBelongingIssueId()`
- **getDate**  
`public java.sql.Date getDate()`
- **getId**  
`public java.lang.Integer getId()`
- **getName**  
`public java.lang.String getName()`
- **hashCode**  
`public native int hashCode()`

- **setBelongingIssueId**  
`public void setBelongingIssueId(java.lang.Integer belongingIssueId)`
- **setDate**  
`public void setDate(java.sql.Date date)`
- **setId**  
`public void setId(java.lang.Integer id)`
- **setName**  
`public void setName(java.lang.String name)`
- **toString**  
`public java.lang.String toString()`

#### 5.4.9. Class IssueComment

##### Declaration

```
public class IssueComment
extends java.lang.Object
```

##### Constructor summary

```
IssueComment\(\)
IssueComment\(Integer, String, String, String, Date, Integer\)
```

##### Method summary

```
equals\(Object\)
getBelongingIssueId\(\)
getDate\(\)
getDevId\(\)
getDevMail\(\)
getId\(\)
getText\(\)
hashCode\(\)
setBelongingIssueId\(Integer\)
setDate\(Date\)
setDevId\(String\)
setDevMail\(String\)
setId\(Integer\)
setText\(String\)
toString\(\)
```

## Constructors

- **IssueComment**  
`public IssueComment()`
- **IssueComment**  
`public IssueComment(java.lang.Integer id, java.lang.String devId, java.lang.String devMail, java.lang.String text, java.util.Date date, java.lang.Integer belongingIssueId)`

## Methods

- **equals**  
`public boolean equals(java.lang.Object arg0)`
- **getBelongingIssueId**  
`public java.lang.Integer getBelongingIssueId()`
- **getDate**  
`public java.util.Date getDate()`
- **getDevId**  
`public java.lang.String getDevId()`
- **getDevMail**  
`public java.lang.String getDevMail()`
- **getId**  
`public java.lang.Integer getId()`
- **getText**  
`public java.lang.String getText()`
- **hashCode**  
`public native int hashCode()`
- **setBelongingIssueId**  
`public void setBelongingIssueId(java.lang.Integer belongingIssueId)`
- **setDate**  
`public void setDate(java.util.Date date)`
- **setDevId**  
`public void setDevId(java.lang.String devId)`
- **setDevMail**  
`public void setDevMail(java.lang.String devMail)`

- **setId**  
public void setId(java.lang.Integer id)
- **setText**  
public void setText(java.lang.String text)
- **toString**  
public java.lang.String toString()

#### 5.4.10. Class Method

##### Declaration

```
public class Method
extends java.lang.Object
```

##### Constructor summary

```
Method()
Method(Integer, Integer, String, Integer, Integer)
```

##### Method summary

```
equals(Object)
getBelongingTypeId()
getId()
getIsConstructor()
getLineNumber()
getReturnTypeId()
hashCode()
setBelongingTypeId(Integer)
setId(Integer)
setIsConstructor(String)
setLineNumber(Integer)
setReturnTypeId(Integer)
toString()
```

##### Constructors

- **Method**  
public Method()
- **Method**  
public Method(java.lang.Integer id, java.lang.Integer lineNumber, java.lang.String isConstructor, java.lang.Integer belongingTypeId, java.lang.Integer returnTypeId)

## Methods

- **equals**  
`public boolean equals(java.lang.Object arg0)`
- **getBelongingTypeId**  
`public java.lang.Integer getBelongingTypeId()`
- **getId**  
`public java.lang.Integer getId()`
- **getIsConstructor**  
`public java.lang.String getIsConstructor()`
- **getLineNumber**  
`public java.lang.Integer getLineNumber()`
- **getReturnTypeId**  
`public java.lang.Integer getReturnTypeId()`
- **hashCode**  
`public native int hashCode()`
- **setBelongingTypeId**  
`public void setBelongingTypeId(java.lang.Integer belongingTypeId)`
- **setId**  
`public void setId(java.lang.Integer id)`
- **setIsConstructor**  
`public void setIsConstructor(java.lang.String isConstructor)`
- **setLineNumber**  
`public void setLineNumber(java.lang.Integer lineNumber)`
- **setReturnTypeId**  
`public void setReturnTypeId(java.lang.Integer returnTypeId)`
- **toString**  
`public java.lang.String toString()`

### 5.4.11. Class MethodComment

#### Declaration

```
public class MethodComment
extends java.lang.Object
```

**Constructor summary**

[MethodComment\(\)](#)  
[MethodComment\(Integer, Integer\)](#)

**Method summary**

[equals\(Object\)](#)  
[getCommentId\(\)](#)  
[getMethodId\(\)](#)  
[hashCode\(\)](#)  
[setCommentId\(Integer\)](#)  
[setMethodId\(Integer\)](#)  
[toString\(\)](#)

**Constructors**

- **MethodComment**  
`public MethodComment()`
- **MethodComment**  
`public MethodComment(java.lang.Integer methodId, java.lang.Integer commentId)`

**Methods**

- **equals**  
`public boolean equals(java.lang.Object arg0)`
- **getCommentId**  
`public java.lang.Integer getCommentId()`
- **getMethodId**  
`public java.lang.Integer getMethodId()`
- **hashCode**  
`public native int hashCode()`
- **setCommentId**  
`public void setCommentId(java.lang.Integer commentId)`
- **setMethodId**  
`public void setMethodId(java.lang.Integer methodId)`
- **toString**  
`public java.lang.String toString()`

### 5.4.12. Class MethodInvocation

#### Declaration

```
public class MethodInvocation  
extends java.lang.Object
```

#### Constructor summary

```
MethodInvocation\(\)  
MethodInvocation\(Integer, Integer\)
```

#### Method summary

```
equals\(Object\)  
getInvokedMethodId\(\)  
getInvokerMethodId\(\)  
hashCode\(\)  
setInvokedMethodId\(Integer\)  
setInvokerMethodId\(Integer\)  
toString\(\)
```

#### Constructors

- **MethodInvocation**  
`public MethodInvocation()`
- **MethodInvocation**  
`public MethodInvocation(java.lang.Integer invokerMethodId, java.lang.Integer invokedMethodId)`

#### Methods

- **equals**  
`public boolean equals(java.lang.Object arg0)`
- **getInvokedMethodId**  
`public java.lang.Integer getInvokedMethodId()`
- **getInvokerMethodId**  
`public java.lang.Integer getInvokerMethodId()`
- **hashCode**  
`public native int hashCode()`
- **setInvokedMethodId**  
`public void setInvokedMethodId(java.lang.Integer invokedMethodId)`

- **setInvokerMethodId**  
public void setInvokerMethodId(java.lang.Integer invokerMethodId)
- **toString**  
public java.lang.String toString()

### 5.4.13. Class MethodsChangeInCommit

#### Declaration

```
public class MethodsChangeInCommit  
extends java.lang.Object
```

#### Constructor summary

```
MethodsChangeInCommit()  
MethodsChangeInCommit(Integer, String, Integer)
```

#### Method summary

```
equals(Object)  
hashCode()  
toString()
```

#### Constructors

- **MethodsChangeInCommit**  
public MethodsChangeInCommit()
- **MethodsChangeInCommit**  
public MethodsChangeInCommit(java.lang.Integer id, java.lang.String modifiedMethod, java.lang.Integer proprietaryFileId)

#### Methods

- **equals**  
public boolean equals(java.lang.Object arg0)
- **hashCode**  
public native int hashCode()
- **toString**  
public java.lang.String toString()

### 5.4.14. Class Metric

#### Declaration

```
public class Metric  
extends java.lang.Object
```

#### All known subclasses

ProjectMetric (in [5.4.18](#), page [72](#)), PackageMetric (in [5.4.16](#), page [68](#)), MetricMethod (in [5.4.15](#), page [66](#))

#### Field summary

```
BCCM_DESCRIPTION  
BCCM_NAME  
CHANGE_SET_SIZE_DESCRIPTION  
CHANGE_SET_SIZE_NAME  
ECCM_DESCRIPTION  
ECCM_NAME  
ECCM_STATIC_DESCRIPTION  
ECCM_STATIC_NAME  
MAX_LINES_DESCRIPTION  
MAX_LINES_NAME  
MEAN_LINES_DESCRIPTION  
MEAN_LINES_NAME  
NAUTH_DESCRIPTION  
NAUTH_NAME  
NCHANGE_DESCRIPTION

### 5.4.17. Class Project

#### Declaration

```
public class Project
extends java.lang.Object
```

#### Constructor summary

```
Project\(\)
Project\(Integer, String, String, String\)
```

#### Method summary

```
equals\(Object\)
getBugtrackerUrl\(\)
getId\(\)
getName\(\)
getVersioningUrl\(\)
hashCode\(\)
setBugtrackerUrl\(String\)
setId\(Integer\)
setName\(String\)
setVersioningUrl\(String\)
toString\(\)
```

#### Constructors

- **Project**  
`public Project()`
- **Project**  
`public Project(java.lang.Integer id, java.lang.String name, java.lang.String versioningUrl, java.lang.String bugtrackerUrl)`

#### Methods

- **equals**  
`public boolean equals(java.lang.Object arg0)`
- **getBugtrackerUrl**  
`public java.lang.String getBugtrackerUrl()`
- **getId**

#### 5.4.18. Class ProjectMetric

##### Declaration

```
public class ProjectMetric
extends it.unisa.sesa.repominer.db.entities.Metric (in 5.4.14, page 63)
```

##### Constructor summary

```
ProjectMetric\(\)
ProjectMetric\(Integer, String, String, Integer, Integer, Double, Date, Date\)
```

##### Method summary

```
equals\(Object\)
getEnd\(\)
getMetricId\(\)
getProjectId\(\)
getStart\(\)
getValue\(\)
hashCode\(\)
```

```
setEnd(Date)
setMetricId(Integer)
setProjectId(Integer)
setStart(Date)
setValue(Double)
toString()
```

## Constructors

- **ProjectMetric**  
`public ProjectMetric()`
- **ProjectMetric**  
`public ProjectMetric(java.lang.Integer id, java.lang.String name, java.lang.String description, java.lang.Integer projectId, java.lang.Integer metricId, java.lang.Double value, java.util.Date start, java.util.Date end)`

## Methods

- **equals**  
`public boolean equals(java.lang.Object arg0)`
- **getEnd**  
`public java.util.Date getEnd()`
- **getMetricId**  
`public java.lang.Integer getMetricId()`
- **getProjectId**  
`public java.lang.Integer getProjectId()`
- **getStart**  
`public java.util.Date getStart()`
- **getValue**  
`public java.lang.Double getValue()`
- **hashCode**  
`public native int hashCode()`
- **setEnd**  
`public void setEnd(java.util.Date end)`
- **setMetricId**  
`public void setMetricId(java.lang.Integer metricId)`
- **setProjectId**  
`public void setProjectId(java.lang.Integer projectId)`

- **setStart**  
public void setStart(java.util.Date start)
- **setValue**  
public void setValue(java.lang.Double value)
- **toString**  
public java.lang.String toString()

public void setTitle(java.lang.String title)
- **setVersioningUrl**  
public void setVersioningUrl(java.lang.String versioningUrl)
- **toString**  
public java.lang.String toString()

## 5.4.20. Class SourceContainer

### Declaration

```
public class SourceContainer  
extends java.lang.Object
```

### Constructor summary

```
SourceContainer()  
SourceContainer(Integer, Integer, Integer)
```

### Method summary

```
equals(Object)  
getId()  
getImportId()  
getName()  
getProjectId()  
hashCode()  
setId(Integer)  
setImportId(Integer)  
setName(String)  
setProjectId(Integer)  
toString()
```

### Constructors

- **SourceContainer**  
public SourceContainer()
- **SourceContainer**  
public SourceContainer(java.lang.Integer id, java.lang.Integer projectId, java.lang.Integer importId)

### Methods

- **equals**  
public boolean equals(java.lang.Object arg0)
- **getId**  
public java.lang.Integer getId()
- **getImportId**  
public java.lang.Integer getImportId()

- **getName**  
`public java.lang.String getName()`
- **getProjectId**  
`public java.lang.Integer getProjectId()`
- **hashCode**  
`public native int hashCode()`
- **setId**  
`public void setId(java.lang.Integer id)`
- **setImportId**  
`public void setImportId(java.lang.Integer importId)`
- **setName**  
`public void setName(java.lang.String name)`
- **setProjectId**  
`public void setProjectId(java.lang.Integer projectId)`
- **toString**  
`public java.lang.String toString()`

#### 5.4.21. Class Type

##### Declaration

```
public class Type
extends java.lang.Object
```

##### Constructor summary

```
Type()
Type(Integer, Integer, Integer, String, String, Integer)
```

##### Method summary

```
equals(Object)
getHeaderFileLocation()
getId()
getImportId()
getLinesNumber()
getSourceContainer()
getSrcFileLocation()
hashCode()
```

```
setHeaderFileLocation(String)
setId(Integer)
setImportId(Integer)
setLinesNumber(Integer)
setSourceContainer(Integer)
setSrcFileLocation(String)
toString()
```

## Constructors

- **Type**  
`public Type()`
- **Type**  
`public Type(java.lang.Integer id, java.lang.Integer importId, java.lang.Integer linesNumber, java.lang.String srcFileLocation, java.lang.String headerFileLocation, java.lang.Integer sourceContainer)`

## Methods

- **equals**  
`public boolean equals(java.lang.Object arg0)`
- **getHeaderFileLocation**  
`public java.lang.String getHeaderFileLocation()`
- **getId**  
`public java.lang.Integer getId()`
- **getImportId**  
`public java.lang.Integer getImportId()`
- **getLinesNumber**  
`public java.lang.Integer getLinesNumber()`
- **getSourceContainer**  
`public java.lang.Integer getSourceContainer()`
- **getSrcFileLocation**  
`public java.lang.String getSrcFileLocation()`
- **hashCode**  
`public native int hashCode()`
- **setHeaderFileLocation**  
`public void setHeaderFileLocation(java.lang.String headerFileLocation)`

- **setId**  
`public void setId(java.lang.Integer id)`
- **setImportId**  
`public void setImportId(java.lang.Integer importId)`
- **setLinesNumber**  
`public void setLinesNumber(java.lang.Integer linesNumber)`
- **setSourceContainer**  
`public void setSourceContainer(java.lang.Integer sourceContainer)`
- **setSrcFileLocation**  
`public void setSrcFileLocation(java.lang.String srcFileLocation)`
- **toString**  
`public java.lang.String toString()`

#### 5.4.22. Class TypeMetric

##### Declaration

```
public class TypeMetric  
extends java.lang.Object
```

##### Constructor summary

```
TypeMetric()  
TypeMetric(Integer, Integer, Double)
```

##### Method summary

```
equals(Object)  
getMetricId()  
getTypeId()  
getValue()  
hashCode()  
setMetricId(Integer)  
setTypeId(Integer)  
setValue(Double)  
toString()
```

**Constructors**

- **TypeMetric**  
public TypeMetric()
- **TypeMetric**  
public TypeMetric(java.lang.Integer typeId, java.lang.Integer metricId, java.lang.Double value)

**Methods**

- **equals**

public java.lang.Integer getMetricId()
- **getTypeId**  
public java.lang.Integer getTypeId()
- **getValue**  
public java.lang.Double getValue()
- **hashCode**  
public native int hashCode()
- **setMetricId**  
public void setMetricId(java.lang.Integer metricId)
- **setTypeId**  
public void setTypeId(java.lang.Integer typeId)
- **setValue**  
public void setValue(java.lang.Double value)
- **toString**  
public java.lang.String toString()

**5.5. Package it.unisa.sesa.repominer.dbscan***Package Contents**Page***Classes**

<b>ChangePoint</b> .....	82
An implementation of (in 5.4.2, page 44) for points with integer coordinates A single (in 5.5.1, page 82) has two instance variables, a (in 5.4.2, page 44) instance and an integer coordinate	
<b>Cluster</b> .....	85

Cluster holding a set of points	
<b>DBSCAN</b> .....	<b>86</b>
DBSCAN (density-based spatial clustering of applications with noise) algorithm	
The DBSCAN algorithm forms clusters based on the idea of density connectivity, i.e. a point p is density connected to another point q, if there exists a chain of points $p_i$ , with $i=1\dots n$ and $p_1=p$ and $p_n=q$ , such that each pair $p_{i+1}$ is directly density-reachable from $p_i$ .	

### 5.5.1. Class ChangePoint

An implementation of (in 5.4.2, page 44) for points with integer coordinates A single (in 5.5.1, page 82) has two instance variables, a (in 5.4.2, page 44) instance and an integer coordinate

#### Declaration

```
public class ChangePoint
extends java.lang.Object
```

#### Constructor summary

**ChangePoint(int, Change)** Build an instance of a point, wrapping a single (in 5.4.2, page 44) instance its coordinate

#### Method summary

**distanceFrom(ChangePoint)** Calculate distance between two ChangePoints

**equals(Object)**

**getChange()** This method returns the (in 5.4.2, page 44) wrapped by this point

**getVisitedFlag()** This method return the flag value used to checking the state of this point; 0 means the point has not been visited; 1 if the point has been classified as noise; 2 if the point has been already put in a cluster

**getX()** This method returns the coordinate for this point

**hashCode()**

**isAlreadyInACluster()**

**isNoise()** This method check if this point has been classified as noise

**isNotVisited()** This method check if this point has been already visited by the algorithm

**setAlreadyInACluster()** Set the point as already in a cluster (flag value 2)

**setChange(Change)** This method set the (in 5.4.2, page 44) specified by this point

[setNoise\(\)](#) Set the point as noise (flag value 1)  
[toString\(\)](#)

## Constructors

- **ChangePoint**  
`public ChangePoint(int x, it.unisa.sesa.repominer.db.entities.Change pChange)`
  - **Description**  
Build an instance of a point, wrapping a single (in [5.4.2](#), page 44) instance its coordinate
  - **Parameters**
    - \* `x` –
    - \* `pChange` –

## Methods

- **distanceFrom**  
`public double distanceFrom(ChangePoint pChangePoint)`
  - **Description**  
Calculate distance between two ChangePoints
  - **Parameters**
    - \* `pChangePoint` – the point used to calculate distance from this point
  - **Returns** – A double value that represent distance between two points
- **equals**  
`public boolean equals(java.lang.Object arg0)`
- **getChange**  
`public it.unisa.sesa.repominer.db.entities.Change getChange()`
  - **Description**  
This method returns the (in [5.4.2](#), page 44) wrapped by this point
  - **Returns** – a (in [5.4.2](#), page 44)
- **getVisitedFlag**  
`public int getVisitedFlag()`
  - **Description**  
This method return the flag value used to checking the state of this point; 0 means the point has not been visited; 1 if the point has been classified as noise; 2 if the point has been already put in a cluster

- **Returns** – the valued of the flag for this point
- **getX**  
`public int getX()`
  - **Description**  
This method returns the coordinate for this point
  - **Returns** – the coordinate for this point
- **hashCode**  
`public native int hashCode()`
- **isAlreadyInACluster**  
`public boolean isAlreadyInACluster()`
- **isNoise**  
`public boolean isNoise()`
  - **Description**  
This method check if this point has been classified as noise
  - **Returns** – true if the point is a noise point; false otherwise
- **isNotVisited**  
`public boolean isNotVisited()`
  - **Description**  
This method check if this point has been already visited by the algorithm
  - **Returns** – true if this point has been visited; false otherwise
- **setAlreadyInACluster**  
`public void setAlreadyInACluster()`
  - **Description**  
Set the point as already in a cluster (flag value 2)
- **setChange**  
`public void setChange(it.unisa.sesa.repominer.db.entities.Change change)`
  - **Description**  
This method set the (in [5.4.2](#), page 44) specified by this point
  - **Parameters**
    - \* `change` – which the point refers
- **setNoise**  
`public void setNoise()`

- **Description**

Set the point as noise (flag value 1)

- **toString**

public java.lang.String **toString()**

### 5.5.2. Class Cluster

Cluster holding a set of points

#### Declaration

```
public class Cluster
extends java.lang.Object
```

#### Constructor summary

[Cluster\(ChangePoint\)](#) Build a cluster centered at specified point

#### Method summary

[addPoint\(ChangePoint\)](#) Add a point to this cluster

[getCenter\(\)](#) Get the point chosen to be the center of this cluster

[getPoints\(\)](#) Get all points contained in the cluster

#### Constructors

- **Cluster**

public **Cluster**(ChangePoint center)

- **Description**

Build a cluster centered at specified point

- **Parameters**

\* center – the point which is to be the center of this cluster

#### Methods

- **addPoint**

public void **addPoint**(ChangePoint pPoint)

- **Description**

Add a point to this cluster

- **Parameters**

\* pPoint – point to add

- **getCenter**  
`public ChangePoint getCenter()`
  - **Description**  
Get the point chosen to be the center of this cluster
  - **Returns** – chosen cluster center
- **getPoints**  
`public java.util.List getPoints()`
  - **Description**  
Get all points contained in the cluster
  - **Returns** – points contained in the cluster

### 5.5.3. Class DBSCAN

DBSCAN (density-based spatial clustering of applications with noise) algorithm

The DBSCAN algorithm forms clusters based on the idea of density connectivity, i.e. a point  $p$  is density connected to another point  $q$ , if there exists a chain of points  $p_i$ , with  $i=1..n$  and  $p_1=p$  and  $p_n=q$ , such that each pair  $p_{i+1}$  is directly density-reachable from  $p_i$ . A point  $q$  is directly density-reachable from point  $p$  if it is in the  $\epsilon$ -neighborhood of this point.

Any point that is not density-reachable from a formed cluster is treated as noise, and will thus not be present in the results.

The algorithm requires two parameters:

- **eps**: the distance that defines the
- **epsilon-neighborhood of a point minPoints**: the minimum number of density-connected points required to form a cluster

#### Declaration

```
public class DBSCAN
extends java.lang.Object
```

#### Constructor summary

**DBSCAN(double, int)** Creates a new instance of a DBSCAN

#### Method summary

**cluster(List)** Perform DBSCAN cluster analysis  
**getEps()** Return the eps value (maximum radius of the neighborhood to be considered)  
**getMinPoints()** Returns the minimum number of points needed for a cluster

## Constructors

- **DBSCAN**

`public DBSCAN(double eps, int minPoints)`

- **Description**

Creates a new instance of a DBSCAN

- **Parameters**

- \* `eps` – maximum radius of the neighborhood to be considered
    - \* `minPoints` – minimum number of points needed for a cluster

## Methods

- **cluster**

`public java.util.List cluster(java.util.List pPoints)`

- **Description**

Perform DBSCAN cluster analysis

- **Parameters**

- \* `pPoints` – the points to cluster

- **Returns** – the list of Cluster

- **getEps**

`public double getEps()`

- **Description**

Return the eps value (maximum radius of the neighborhood to be considered)

- **Returns** – maximum radius of the neighborhood

- **getMinPoints**

`public int getMinPoints()`

- **Description**

Returns the minimum number of points needed for a cluster

- **Returns** – minimum number of points needed for a cluster

## 5.6. Package

**it.unisa.sesa.repominer.metrics.exception**

### 5.6.1. Exception NoChangesException

This class represents an exception to be thrown when there are not changes stored into the database.

#### Declaration

```
public class NoChangesException
extends java.lang.Exception
```

#### Constructor summary

**NoChangesException()** This method constructs an object of type NoChangesException by setting the message to a default string value No changes found into db.

#### Constructors

- **NoChangesException**  
public NoChangesException()

- **Description**

This method constructs an object of type NoChangesException by setting the message to a default string value No changes found into db.

#### Members inherited from class Throwable

java.lang.Throwable

- public final synchronized void addSuppressed(Throwable arg0)
- public synchronized Throwable fillInStackTrace()
- public synchronized Throwable getCause()
- public String getLocalizedMessage()
- public String getMessage()
- public StackTraceElement getStackTrace()
- public final synchronized Throwable getSuppressed()
- public synchronized Throwable initCause(Throwable arg0)
- public void printStackTrace()
- public void printStackTrace(java.io.PrintStream arg0)
- public void printStackTrace(java.io.PrintWriter arg0)
- public void setStackTrace(StackTraceElement[] arg0)
- public String toString()

## 5.7. Package `it.unisa.sesa.repominer.metrics`

*Package Contents*

*Page*

### Classes

<b>HistoryMetricsCalculator</b> .....	89
This class instantiates and calls methods of (in <a href="#">5.7.3</a> , page 93) and (in <a href="#">5.7.2</a> , page 90).	
<b>PackageMetrics</b> .....	90
This class is responsible to calculate all the history metrics relative to a package.	
<b>ProjectMetrics</b> .....	93
This class is responsible to calculate all the history metrics relative to a project.	

### 5.7.1. Class `HistoryMetricsCalculator`

This class instantiates and calls methods of (in [5.7.3](#), page 93) and (in [5.7.2](#), page 90).

#### Declaration

```
public class HistoryMetricsCalculator
extends java.lang.Object
```

#### Constructor summary

[HistoryMetricsCalculator\(\)](#)

#### Method summary

[calculateMetrics\(Project\)](#) This method calculate project metrics for project passed as argument  
[calculateMetrics\(SourceContainer\)](#) This method calculate package metrics for package passed as argument

#### Constructors

- **HistoryMetricsCalculator**  

```
public HistoryMetricsCalculator()
```

#### Methods

- **calculateMetrics**  

```
public static void calculateMetrics(it.unisa.sesa.repominer.db.entities.Project pProject)
```

- **Description**  
This method calculate project metrics for project passed as argument
- **Parameters**  
\* pProject –
- **calculateMetrics**  
public static void calculateMetrics(it.unisa.sesa.repominer.db.entities.SourceContainer pSourceContainer)
- **Description**  
This method calculate package metrics for package passed as argument
- **Parameters**  
\* pSourceContainer –

### 5.7.2. Class PackageMetrics

This class is responsible to calculate all the history metrics relative to a package.

#### Declaration

```
public class PackageMetrics
extends java.lang.Object
```

#### Constructor summary

[PackageMetrics\(\)](#)

#### Method summary

- [getInsertionsAndDeletionsInfo\(SourceContainer\)](#) This method calculate the Lines metric.
- [getMaxInsertionsOrDeletionsNumber\(SourceContainer\)](#) This method calculate the second value of Lines metric, namely max number of insertion or deletion
- [getMeanDimensionOfModifiedFiles\(SourceContainer\)](#) This method calculate ChangeSetSize metric.
- [getMeanInsertionsOrDeletionsNumber\(SourceContainer\)](#) This method calculate the third value of Lines metric, namely mean number of insertion or deletion
- [getMeanNumberOfChange\(SourceContainer\)](#) This method calculate mean\_NCHANGE metric.
- [getMeanNumberOfChangeForBugFix\(SourceContainer\)](#) This method calculate mean\_NFIX metric.

**getMeanNumberOfChangeForRefactoring(SourceContainer)** This method calculate mean\_NREF metric.

**getNumberOfAuthor(SourceContainer)** This method calculate NR metric.

**getTotalInsertionsOrDeletionsNumber(SourceContainer)** This method calculate the first value of Lines metric, namely sum of insertion or deletion

## Constructors

- **PackageMetrics**  
public **PackageMetrics()**

## Methods

- **getInsertionsAndDelitionsInfo**  
public java.lang.Double[] **getInsertionsAndDelitionsInfo**(it.unisa.sesa.repominer.db.entity.SourceContainer pSourceContainer)  
  - **Description**  
This method calculate the Lines metric. The Lines metric represent the total, mean an maximum number of insertion or deletion
  - **Parameters**  
\* pSourceContainer –
  - **Returns** – Lines metric value
- **getMaxInsertionsOrDeletionsNumber**  
public java.lang.Integer **getMaxInsertionsOrDeletionsNumber**(it.unisa.sesa.repominer.db.entity.SourceContainer pSourceContainer)  
  - **Description**  
This method calculate the second value of Lines metric, namely max number of insertion or deletion
  - **Parameters**  
\* pSourceContainer –
  - **Returns** – Second value for Lines metric
- **getMeanDimensionOfModifiedFiles**  
public double **getMeanDimensionOfModifiedFiles**(it.unisa.sesa.repominer.db.entity.SourceContainer pSourceContainer)  
  - **Description**  
This method calculate ChangeSetSize metric. The ChangeSetSize metric represent mean dimension of modified files in a package

- **Parameters**
  - \* `pSourceContainer` –
- **Returns** – `ChangeSetSize` metric value
- **getMeanInsertionsOrDeletionsNumber**  
`public java.lang.Double getMeanInsertionsOrDeletionsNumber(it.unisa.sesa.repor  
pSourceContainer)`
  - **Description**  
This method calculate the third value of `Lines` metric, namely mean number of insertion or deletion
  - **Parameters**
    - \* `pSourceContainer` –
  - **Returns** – Third value for `Lines` metric
- **getMeanNumberOfChange**  
`public double getMeanNumberOfChange(it.unisa.sesa.repominer.db.entities.Sour  
pSourceContainer)`
  - **Description**  
This method calculate `mean_NCHANGE` metric. The `mean_NCHANGE` metric represent mean number of file changes in a package
  - **Parameters**
    - \* `pSourceContainer` –
  - **Returns** – `mean_NCHANGE` metric value
- **getMeanNumberOfChangeForBugFix**  
`public double getMeanNumberOfChangeForBugFix(it.unisa.sesa.repominer.db.ent  
pSourceContainer)`
  - **Description**  
This method calculate `mean_NFIX` metric. The `mean_NFIX` metric represent mean number of file changes in a package caused by bug fixes
  - **Parameters**
    - \* `pSourceContainer` –
  - **Returns** – `mean_NFIX` metric value
- **getMeanNumberOfChangeForRefactoring**  
`public double getMeanNumberOfChangeForRefactoring(it.unisa.sesa.repominer.db  
pSourceContainer)`

- **Description**  
This method calculate mean\_NREF metric. The mean\_NREF metric represent mean number of file changes in a package caused by refactoring operation
- **Parameters**  
    \* pSourceContainer –
- **Returns** – mean\_NREF metric value
- **getNumberOfAuthor**  
`public int getNumberOfAuthor(it.unisa.sesa.repominer.db.entities.SourceContainer pSourceContainer)`
  - **Description**  
This method calculate NR metric. The NR metric represent system number of revision
  - **Parameters**  
    \* pSourceContainer –
  - **Returns** – NR metric value
- **getTotalInsertionsOrDeletionsNumber**  
`public java.lang.Integer getTotalInsertionsOrDeletionsNumber(it.unisa.sesa.repo.pSourceContainer)`
  - **Description**  
This method calculate the first value of Lines metric, namely sum of insertion or deletion
  - **Parameters**  
    \* pSourceContainer –
  - **Returns** – First value for Lines metric

### 5.7.3. Class ProjectMetrics

This class is responsible to calculate all the history metrics relative to a project.

#### Declaration

```
public class ProjectMetrics
extends java.lang.Object
```

#### Constructor summary

[ProjectMetrics\(\)](#)

## Method summary

- getBCCMMetric(Project, Date, Date)** This method calculate the value of BCC Metric; it calculates this value only considering changes occurred in time based period between the start and the end date specified in preference panel
- getBCCPeriodBased(Project, int, String)** This method calculate a set of values of BCC Metric; it calculates this values broken the history of changes into equal length periods based on calendar time from the start of the project.
- getECCBurstBased(Project, int, int, boolean)** This method break history into burst based periods and then calculates the value of ECC Model on this periods
- getECCModificationBased(Project, int, boolean)** This method calculate a set of values of ECC Model using modification limit period based; it calculates this values broken the history of changes into period based on number of modifications specified in preferences panel.
- getECCPeriodBased(Project, int, String, Boolean)** This method calculate a set of values of ECC Model using time based periods method; it calculates this values broken the history of changes into equal length periods based on calendar time from the start of the project.
- getNumberOfRevision(Project)** Calculate the NR metric, that represents the system number of revision

## Constructors

- **ProjectMetrics**  
`public ProjectMetrics()`

## Methods

- **getBCCMMetric**  
`public it.unisa.sesa.repominer.db.entities.ProjectMetric getBCCMMetric(it.unisa.sesa.repominer.db.entities.Project pProject, java.util.Date pPeriodStart, java.util.Date pPeriodEnd)` throws `it.unisa.sesa.repominer.metrics`
- **Description**  
 This method calculate the value of BCC Metric; it calculates this value only considering changes occurred in time based period between the start and the end date specified in preference panel
- **Parameters**
  - \* `pProject` – project analyzed
  - \* `pPeriodStart` – start date for analysis

- \* pPeriodEnd – end date for analysis
  - **Returns** – BCC Metric
- **getBCCPeriodBased**  
 public java.util.List getBCCPeriodBased(it.unisa.sesa.repominer.db.entities.Pro  
 pProject, int periodLength, java.lang.String periodType)
  - **Description**  
 This method calculate a set of values of BCC Metric; it calculates this values broken the history of changes into equal length periods based on calendar time from the start of the project. The length of a single interval time is specified in preference panel
  - **Parameters**
    - \* pProject – project analyzed
    - \* periodLength – length of period for analysis
    - \* periodType – weeks, months or year for period of analysis
  - **Returns** – some BCC Model values time period based
- **getECCBurstBased**  
 public java.util.List getECCBurstBased(it.unisa.sesa.repominer.db.entities.Pro  
 pProject, int pEps, int pMinPoints, boolean pIsStatic) throws it.unisa.sesa.rep
  - **Description**  
 This method break history into burst based periods and then calculates the value of ECC Model on this periods
  - **Parameters**
    - \* pProject – project analyzed
    - \* pEps – eps parameter for dbscan analysis
    - \* pMinPoints – minPoint parameter for dbscan analysis
    - \* pIsStatic – if true calculates ECCM with Normalized Static Entropy; if false calculates ECCM with Adaptive Sizing Entropy
  - **Returns** – a list of ECC Model values
- **getECCModificationBased**  
 public java.util.List getECCModificationBased(it.unisa.sesa.repominer.db.entit  
 pProject, int pLimit, boolean pIsStatic) throws it.unisa.sesa.repominer.metrics.
  - **Description**  
 This method calculate a set of values of ECC Model using modification limit period based; it calculates this values broken the history of changes into period

based on number of modifications specified in preferences panel. To prevent a period where little development may have occurred from spanning a long time, we impose a limit of 3 months on a period even if the modification limit was not reached

– **Parameters**

- \* **pProject** – project analyzed
- \* **pLimit** – limit of modifications for breaking periods
- \* **pIsStatic** – if true calculated with Normalized Static Entropy; if false calculated with our Adaptive Sizing Entropy

– **Returns** – some ECC Model value calculated with modification limit period method

• **getECCPeriodBased**

```
public java.util.List getECCPeriodBased(it.unisa.sesa.repominer.db.entities.Pr
pProject, int pPeriod, java.lang.String periodType, java.lang.Boolean
pIsStatic)
```

– **Description**

This method calculate a set of values of ECC Model using time based periods method; it calculates this values broken the history of changes into equal length periods based on calendar time from the start of the project. The length of a single interval time is specified in preference panel

– **Parameters**

- \* **pProject** – project analyzed
- \* **pPeriod** – length of period for analysis
- \* **periodType** – weeks, months or years for period of analysis
- \* **pIsStatic** – if true calculates ECCM with Normalized Static Entropy; if false calculates ECCM with Adaptive Sizing Entropy

– **Returns** – some ECC Model values calculated with time based periods method

• **getNumberOfRevision**

```
public it.unisa.sesa.repominer.db.entities.ProjectMetric getNumberO-
fRevision(it.unisa.sesa.repominer.db.entities.Project pProject)
```

– **Description**

Calculate the NR metric, that represents the system number of revision

– **Parameters**

- \* **pProject** – project analyzed

– **Returns** – the NR metric value

## 5.8. Package

### it.unisa.sesa.repominer.preferences.exceptions

*Package Contents*

*Page*

#### 5.8.1. Exception IntegerPreferenceException

This exception is thrown when a preference is not an int value

##### Declaration

```
public class IntegerPreferenceException
extends java.lang.Exception
```

##### Constructor summary

**IntegerPreferenceException(String, int)** This constructor creates an IntegerPreferenceException initializing some instance variables.

##### Method summary

**getPreferenceName()** This method returns the name of the preference that caused this exception to be thrown.

**getPreferenceValue()** This method returns the value of the preference that caused this exception to be thrown.

##### Constructors

- **IntegerPreferenceException**

```
public IntegerPreferenceException(java.lang.String pPreferenceName,
int pPreferenceValue)
```

- **Description**

This constructor creates an IntegerPreferenceException initializing some instance variables.

- **Parameters**

- \* **pPreferenceName** – The name of the preference that caused this exception to be thrown.
    - \* **pPreferenceValue** – The value of the preference that caused this exception to be thrown.

## Methods

- **getPreferenceName**

```
public java.lang.String getPreferenceName()
```

- **Description**

This method returns the name of the preference that caused this exception to be thrown.

- **Returns** – A String object representing the name of the preference that caused this exception to be thrown.

- **getPreferenceValue**

```
public int getPreferenceValue()
```

- **Description**

This method returns the value of the preference that caused this exception to be thrown.

- **Returns** – An int value representing the value of the preference that caused this exception to be thrown.

## Members inherited from class Throwable

```
java.lang.Throwable
```

- `public final synchronized void addSuppressed(Throwable arg0)`
- `public synchronized Throwable fillInStackTrace()`
- `public synchronized Throwable getCause()`
- `public String getLocalizedMessage()`
- `public String getMessage()`
- `public StackTraceElement getStackTrace()`
- `public final synchronized Throwable getSuppressed()`
- `public synchronized Throwable initCause(Throwable arg0)`
- `public void printStackTrace()`
- `public void printStackTrace(java.io.PrintStream arg0)`
- `public void printStackTrace(java.io.PrintWriter arg0)`
- `public void setStackTrace(StackTraceElement[] arg0)`
- `public String toString()`

### 5.8.2. Exception PeriodLengthTooLong

#### Declaration

```
public class PeriodLengthTooLong  
extends java.lang.Exception
```

## Constructor summary

**PeriodLengthTooLong(int, int)** This constructor builds an object of type `PeriodLengthTooLong` by setting the message of the exception to a string representation indicating the limit exceeded and the value that exceeded that limit.

## Constructors

- **PeriodLengthTooLong**

`public PeriodLengthTooLong(int pLimit, int pLength)`

- **Description**

This constructor builds an object of type `PeriodLengthTooLong` by setting the message of the exception to a string representation indicating the limit exceeded and the value that exceeded that limit.

- **Parameters**

- \* `pLimit` –

- \* `pLength` –

## Members inherited from class `Throwable`

`java.lang.Throwable`

- `public final synchronized void addSuppressed(Throwable arg0)`
- `public synchronized Throwable fillInStackTrace()`
- `public synchronized Throwable getCause()`
- `public String getLocalizedMessage()`
- `public String getMessage()`
- `public StackTraceElement getStackTrace()`
- `public final synchronized Throwable getSuppressed()`
- `public synchronized Throwable initCause(Throwable arg0)`
- `public void printStackTrace()`
- `public void printStackTrace(java.io.PrintStream arg0)`
- `public void printStackTrace(java.io.PrintWriter arg0)`
- `public void setStackTrace(StackTraceElement[] arg0)`
- `public String toString()`

## 5.9. Package `it.unisa.sesa.repominer.preferences`

<i>Package Contents</i>	<i>Page</i>
<b>Classes</b>	
<b>PreferenceConstants</b> ..... 100	
Constant definitions for plug-in preferences	
<b>PreferenceInitializer</b> ..... 102	
Class used to initialize default preference values.	
<b>PreferencePage</b> ..... 102	
This class represents a preference page that is contributed to the Preferences dialog.	
<b>Preferences</b> ..... 103	

### 5.9.1. Class `PreferenceConstants`

Constant definitions for plug-in preferences

#### Declaration

```
public class PreferenceConstants
extends java.lang.Object
```

#### Field summary

```
BURST_EPS
BURST_MINPOINTS
ECCM_BURST_VALUE
ECCM_MODALITY
ECCM_MODIFICATION_LIMIT
ECCM_MODIFICATION_VALUE
ECCM_TIME_VALUE
P_DBHOST
P_DBNAME
P_DBPASS
P_DBPORT
P_DBUSER
PERIOD_END
PERIOD_LENGTH
PERIOD_START
PERIOD_TYPE
PERIOD_TYPE_MONTH
```

**PERIOD\_TYPE\_WEEK**  
**PERIOD\_TYPE\_YEAR**

### Constructor summary

**PreferenceConstants()**

### Fields

- public static final java.lang.String **P\_DBPORT**
- public static final java.lang.String **P\_DBHOST**
- public static final java.lang.String **P\_DBNAME**
- public static final java.lang.String **P\_DBUSER**
- public static final java.lang.String **P\_DBPASS**
- public static final java.lang.String **PERIOD\_START**
- public static final java.lang.String **PERIOD\_END**
- public static final java.lang.String **PERIOD\_LENGTH**
- public static final java.lang.String **PERIOD\_TYPE**
- public static final java.lang.String **PERIOD\_TYPE\_WEEK**
- public static final java.lang.String **PERIOD\_TYPE\_MONTH**
- public static final java.lang.String **PERIOD\_TYPE\_YEAR**
- public static final java.lang.String **ECCM\_MODALITY**
- public static final java.lang.String **ECCM\_MODIFICATION\_LIMIT**
- public static final java.lang.String **ECCM\_MODIFICATION\_VALUE**
- public static final java.lang.String **ECCM\_TIME\_VALUE**
- public static final java.lang.String **ECCM\_BURST\_VALUE**
- public static final java.lang.String **BURST\_EPS**
- public static final java.lang.String **BURST\_MINPOINTS**

### Constructors

- **PreferenceConstants**  
public **PreferenceConstants()**

### 5.9.2. Class PreferenceInitializer

Class used to initialize default preference values.

#### Declaration

```
public class PreferenceInitializer  
extends AbstractPreferenceInitializer
```

#### Constructor summary

[PreferenceInitializer\(\)](#)

#### Method summary

[initializeDefaultPreferences\(\)](#)

#### Constructors

- **PreferenceInitializer**  
public **PreferenceInitializer()**

#### Methods

- **initializeDefaultPreferences**  
public void **initializeDefaultPreferences()**

### 5.9.3. Class PreferencePage

This class represents a preference page that is contributed to the Preferences dialog. By subclassing FieldEditorPreferencePage, we can use the field support built into JFace that allows us to create a page that is small and knows how to save, restore and apply itself.

This page is used to modify preferences only. They are stored in the preference store that belongs to the main plug-in class. That way, preferences can be accessed directly via the preference store.

#### Declaration

```
public class PreferencePage  
extends FieldEditorPreferencePage
```

#### Constructor summary

[PreferencePage\(\)](#)

### Method summary

[`createFieldEditors\(\)`](#) Creates the field editors.  
[`init\(IWorkbench\)`](#)

### Constructors

- **PreferencePage**  
`public PreferencePage()`

### Methods

- **createFieldEditors**  
`public void createFieldEditors()`
  - **Description**  
Creates the field editors. Field editors are abstractions of the common GUI blocks needed to manipulate various types of preferences. Each field editor knows how to save and restore itself.
- **init**  
`public void init(IWorkbench workbench)`

## 5.9.4. Class Preferences

### Declaration

```
public class Preferences
extends java.lang.Object
```

### Constructor summary

[`Preferences\(\)`](#)

### Method summary

[`getDatabaseHost\(\)`](#) This method fetches the value of database host from the Eclipse preference store.  
[`getDatabaseName\(\)`](#) This method fetches the value of database name from the Eclipse preference store.  
[`getDatabasePassword\(\)`](#) This method fetches the value of database user's password from the Eclipse preference store.  
[`getDatabasePort\(\)`](#) This method fetches the value of database port from the Eclipse preference store.  
[`getDatabaseUser\(\)`](#) This method fetches the value of database username from the Eclipse preference store.

- getECCMModality()** This method fetches the value of the Extended Code Change Model metric modality from the Eclipse preference store.
- getECCMModificationLimit()** This method fetches the value of the modification limit value for the Extended Code Change Model metric.
- getEpsParameter()** This method fetches the value of radius parameter for DBSCAN algorithm from Eclipse preference store.
- getMinPointsParameter()** This method fetches the value of the minimum size per cluster relative to the DBSCAN algorithm from Eclipse preference store.
- getPeriodEndingDate()** This method fetches the value for the period ending date for the Basic Code Change Model metric.
- getPeriodLength()** This method fetches the value of the period length from the Eclipse preference store.
- getPeriodStartingDate()** This method fetches the value for the period starting date for the Basic Code Change Model metric.
- getPeriodType()** This method fetches the value of the period type from Eclipse preference store.

## Constructors

- **Preferences**  
`public Preferences()`

## Methods

- **getDatabaseHost**  
`public static java.lang.String getDatabaseHost()`
  - **Description**  
This method fetches the value of database host from the Eclipse preference store.
  - **Returns** – A String object representing the database host to which the application connects.
- **getDatabaseName**  
`public static java.lang.String getDatabaseName()`
  - **Description**  
This method fetches the value of database name from the Eclipse preference store.
  - **Returns** – A String object representing the database name to which the application connects.
- **getDatabasePassword**  
`public static java.lang.String getDatabasePassword()`

- **Description**  
This method fetches the value of database user's password from the Eclipse preference store.
- **Returns** – A String object representing the database users's password with which the application logs into DBMS.
- **getDatabasePort**  
`public static int getDatabasePort()`
  - **Description**  
This method fetches the value of database port from the Eclipse preference store.
  - **Returns** – A int value representing the port on which the DBMS is listening to.
- **getDatabaseUser**  
`public static java.lang.String getDatabaseUser()`
  - **Description**  
This method fetches the value of database username from the Eclipse preference store.
  - **Returns** – A String object representing the database username with which the application logs into DBMS.
- **getECCMModality**  
`public static java.lang.String getECCMModality()`
  - **Description**  
This method fetches the value of the Extended Code Change Model metric modality from the Eclipse preference store.
  - **Returns** – A String object representing the Extended Code Change Model metric modality.
- **getECCMModificationLimit**  
`public static int getECCMModificationLimit() throws it.unisa.sesa.repominer.pr`
  - **Description**  
This method fetches the value of the modification limit value for the Extended Code Change Model metric. Value is fetched from the Eclipse preference store.
  - **Returns** – An int value representing value for the modification limit.
  - **Throws**
    - \* `it.unisa.sesa.repominer.preferences.exceptions.IntegerPreferenceException`
      - This exception is thrown when the value is not a positive int number.

- **getEpsParameter**

`public static int getEpsParameter()` throws `it.unisa.sesa.repominer.preferences.`

- **Description**

This method fetches the value of radius parameter for DBSCAN algorithm from Eclipse preference store.

- **Returns** – A int value representing the radius of the DBSCAN algorithm.

- **Throws**

- \* `it.unisa.sesa.repominer.preferences.exceptions.IntegerPreferenceException` – Thrown when the value fetched is not a positive number.

- **getMinPointsParameter**

`public static int getMinPointsParameter()` throws `it.unisa.sesa.repominer.preferen`

- **Description**

This method fetches the value of the minimum size per cluster relative to the DBSCAN algorithm from Eclipse preference store.

- **Returns** – A int value representing the minimum size per cluster relative to the DBSCAN algorithm.

- **Throws**

- \* `it.unisa.sesa.repominer.preferences.exceptions.IntegerPreferenceException` – Thrown when the value fetched is not a positive number.

- **getPeriodEndingDate**

`public static java.util.Date getPeriodEndingDate()` throws `java.text.ParseException`

- **Description**

This method fetches the value for the period ending date for the Basic Code Change Model metric. Value is fetched from the Eclipse preference store.

- **Returns** – A Date object representing the ending date for the interval in which to calculate Basic Code Change Model metric.

- **Throws**

- \* `java.text.ParseException` – This exception is thrown when the string fetched from Eclipse preference store is not parsable as a valid Date.

- **getPeriodLength**

`public static int getPeriodLength()` throws `it.unisa.sesa.repominer.preferences.e`  
`it.unisa.sesa.repominer.preferences.exceptions.PeriodLengthTooLong`

- **Description**  
This method fetches the value of the period length from the Eclipse preference store.
  - **Returns** – An int value representing the value for the period length.
  - **Throws**
    - \* `it.unisa.sesa.repominer.preferences.exceptions.IntegerPreferenceException`  
– Thrown when the value fetched is not positive number.
    - \* `it.unisa.sesa.repominer.preferences.exceptions.PeriodLengthTooLong`  
– Thrown when the value exceeds a limit (4000 when considering weeks, 1000 when months, 80 years).
- **getPeriodStartingDate**  
`public static java.util.Date getPeriodStartingDate() throws java.text.ParseException`
    - **Description**  
This method fetches the value for the period starting date for the Basic Code Change Model metric. Value is fetched from the Eclipse preference store.
    - **Returns** – A Date object representing the starting date for the interval in which to calculate Basic Code Change Model metric.
    - **Throws**
      - \* `java.text.ParseException` – This exception is thrown when the string fetched from Eclipse preference store is not parsable as a valid Date.
  - **getPeriodType**  
`public static java.lang.String getPeriodType()`
    - **Description**  
This method fetches the value of the period type from Eclipse preference store.
    - **Returns** – A String object representing the period type relative to the Extended Code Change Model metric.

## 5.10. Package `it.unisa.sesa.repominer.util.snippets`

*Package Contents*

*Page*

**Classes**

**Test** ..... 108

### 5.10.1. Class Test

#### Declaration

```
public class Test
extends java.lang.Object
```

#### Constructor summary

[Test\(\)](#)

#### Method summary

[main\(String\[\]\)](#)

#### Constructors

- **Test**  
public Test()

#### Methods

- **main**  
public static void main(java.lang.String[] args)

## 5.11. Package it.unisa.sesa.repominer.util

### *Package Contents*

*Page*

#### Classes

Utils ..... [108](#)

### 5.11.1. Class Utils

#### Declaration

```
public class Utils
extends java.lang.Object
```

#### Constructor summary

[Utils\(\)](#)

## Method summary

- dateToCalendar(Date)** This method convert an instance of Date into an instance of Calendar
- daysBetween(Calendar, Calendar)** This method calculates difference in days between two dates
- log2(double)** This function calculate the base-2 logarithm of a float number
- msgIsBugFixing(String)** Checks whether or not a message is likely to be a bug-fixing one.
- msgIsRefactoring(String)** Checks whether or not a message is likely to be a refactoring one.
- stringToDate(String)** This method convert a String into a Date

## Constructors

- **Utils**  
public **Utils()**

## Methods

- **dateToCalendar**  
public static java.util.Calendar **dateToCalendar**(java.util.Date pDate)  
  - **Description**  
This method convert an instance of Date into an instance of Calendar
  - **Parameters**  
\* pDate –
  - **Returns** – A Calendar object
- **daysBetween**  
public static int **daysBetween**(java.util.Calendar startDate, java.util.Calendar endDate)  
  - **Description**  
This method calculates difference in days between two dates
  - **Parameters**  
\* startDate – start date  
\* endDate – end date
  - **Returns** – days from start date to end date
- **log2**  
public static double **log2**(double pValue)

- **Description**  
This function calculate the base-2 logarithm of a float number
- **Parameters**
  - \* pValue –
- **Returns** – Base-2 logarithm value
- **msgIsBugFixing**  
`public static boolean msgIsBugFixing(java.lang.String msg)`
  - **Description**  
Checks whether or not a message is likely to be a bug-fixing one.
  - **Parameters**
    - \* msg – The message to check.
  - **Returns** – true if message is bug-fixing, false otherwise.
- **msgIsRefactoring**  
`public static boolean msgIsRefactoring(java.lang.String msg)`
  - **Description**  
Checks whether or not a message is likely to be a refactoring one.
  - **Parameters**
    - \* msg – The message to check.
  - **Returns** – true if message is refactoring, false otherwise.
- **stringToDate**  
`public static java.util.Date stringToDate(java.lang.String pString) throws java.text.ParseException`
  - **Description**  
This method convert a String into a Date
  - **Parameters**
    - \* pString –
  - **Returns** – A Date Object

## 6. Glossario

Termine	Descrizione
Attributo	Un attributo rappresenta una proprietà di un oggetto; ha un nome, un tipo e può avere un valore di default. Gli attributi rappresentano lo stato dell'oggetto e non sono condivisi con altri oggetti.
Accoppiamento	Il grado di dipendenza tra due elementi
Classe	Astrazione che specifica lo stato e il comportamento di un insieme di oggetti.
Classe Astratta	Una classe che non ha oggetti istanziati da essa.
Costruttore	Una operazione che crea un oggetto e inizializza il suo stato.
Coesione	Il grado di parentela di un'unità incapsulata.
Database relazionali	Raccolta di informazioni di vario tipo, strutturate in modo da essere facilmente reperibili in base a una chiave di ricerca primaria determinata. Le tabelle contengono dati logicamente correlati e sono messe in relazione tra loro.
Interfaccia	L'insieme di tutte le signature definite per le operazioni di un oggetto. L'interfaccia definisce l'insieme delle richieste alle quali l'oggetto può rispondere.
JavaDoc	Strumento che estrae dai commenti di un programma una documentazione dettagliata del codice.
Metodi	Funzioni e procedure che operano sui dati di un oggetto. I programmi dovrebbero interagire con i dati di una classe solo attraverso i suoi metodi.
Package	Costrutto Java che fornisce un raggruppamento di un insieme di classe e interfacce in relazione tra loro.
Parametro	Una variabile passata ad un parametro quando viene chiamato.
Polimorfismo	Oggetti diversi in grado di rispondere allo stesso messaggio in modi diversi; permette agli oggetti di interagire tra loro senza conoscere il tipo esatto.

Override	A volte è necessario eseguire l'override (ridefinizione) di attributi e/o metodi in sottoclassi.
Signature	Firma di un metodo; è infatti costruita dal nome dell'operazione, dalla lista completa dei parametri e dal tipo del valore di ritorno.
Superclasse	Se la classe B eredita dalla classe A; si dice che A è una superclasse di B.
Sottoclasse	Se la classe B eredita dalla classe A, diciamo che B è una sottoclasse di A.
